Preface

This manual describes how to use Migration Center to perform database migration to ALTIBASE.

Audience

This manual has been prepared for the following Altibase users:

- Database administrators
- Performance administrators
- Database users
- Application developers
- Technical Supporters

It is recommended for those reading this manual possess the following background knowledge:

- Basic knowledge in the use of computers, operating systems, and operating system utilities
- Experience in using relational database and an understanding of database concepts
- Computer programming experience
- Experience in database server management, operating system management, or network administration

Organization

This manual is organized as follows:

- Chapter 1: Introduction
This chapter introduces Migration Center and explains how to install it.
- Chapter 2: Getting Started
This chapter describes the key concepts in migration, how to use Migration Center in GUI and CLI modes, and tools provided for user convenience.
- Chapter 3: GUI Mode Quick Guide
This chapter provides a quick step guide for GUI mode users who are new to Migration Center.
- Chapter 4: CLI Mode Quick Guide
This chapter provides a quick step guide for CLI mode users who are new to Migration Center.
- Chapter 5: Migration Center Internals
This chapter describes the main steps of Migration Center, namely the Build, Reconcile, Run, and Data Validation steps.
- Appendix A: Migration Options
This appendix describes the Migration Center options.
- Appendix B: Migratable Database Objects
This appendix provides the table that shows what database objects can be migrated using Migration Center.
- Appendix C: Data Type Mapping
This appendix explains how to check and customize the default data type mapping for an existing project. In addition, it provides default data type mapping tables

- Appendix D: Mapping Default Values
This appendix provides the mapping table for default values according to which Migration Center converts source database default values to comply with Altibase.
- Appendix E: PSM Converter Rule List
This chapter describes the rules for converting PSM convertes to DDL SQL statements when migrating from Oracle to Altibase.
- Appendix F: FAQ

Documentation Conventions

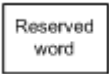

This section describes the conventions used in this manual. Understanding these conventions will make it easier to find information in this manual and in the other manuals in the series.

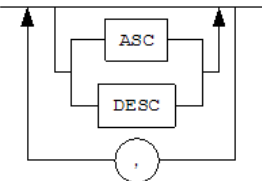

There are two sets of conventions:

- Syntax diagram convetions
- Sample code conventions

Syntax Diagram Conventions

This manual describes command syntax using diagrams composed of the following elements:

Elements	Meaning
	Indicates the start of a command. If a syntactic element starts with an arrow, it is not a complete command.
	Indicates that the command continues to the next line. If a syntactic element ends with this symbol, it is not a complete command.
	Indicates taht the command continues from the previous line. If a syntactic element starts with his symbol, it is not a complete command.
	Indicates the end of a statement.
	Indicates a manatory element.
	Indicates an optional element.
	Indicates a mandatory element comprised of options. One, and only one, option must be specified.
	Indicates an optional element comprised of options.

Elements	Meaning
	Indicates an optional element in which multiple elements may be specified. A comma must precede all but the first element.

Sample Code Conventions

The code examples explain SQL statements, stored procedures, iSQL statements, and other command line syntax.

The following table describes the printing conventions used in the code examples.

Rules	Meaning	Example
[]	Indicates an optional item	VARCHAR [(size)] [[FIXED] VARIABLE]
{ }	Indicates a mandatory field for which one or more items must be selected.	{ ENABLE DISABLE COMPILE }
	A delimiter between optional or mandatory arguments.	{ ENABLE DISABLE COMPILE } [ENABLE DISABLE COMPILE]
...	Indicates that the previous argument is repeated, or that sample code has been omitted.	SQL> SELECT ename FROM employee; ENAME ----- SWNO HJNO HSCHOI . . . 20 rows selected.
Other Symbols	Symbols other than those shown above are part of the actual code.	EXEC :p1 := 1; acc NUMBER(11,2)
Italics	Statement elements in italics indicate variables and special values specified by the user.	SELECT * FROM <i>table_name</i> ; CONNECT <i>userID/password</i> ;
Lower case words	Indicate program elements set by the user, such as table names, column names, file names, etc.	SELECT ename FROM employee;
Upper case words	Keywords and all elements provided by the system appear in upper case.	DESC SYSTEM.SYS_INDICES;

Altibase Welcomes Your Comments and Feedbacks

Please let us know what you like or dislike about our manuals. To help us with better future versions of our manuals, please tell us if there is any corrections or classifications that you would find useful.

Include the following information:

- The name and version of the manual that you are using
- Any comments about the manual
- Your name, address, and phone number

If you need immediate assistance regarding any errors, omissions, and other technical issues, please contact [Altibase's Support Portal](#).

Thank you. We always welcome your feedbacks and suggestions.

1. Introduction

This chapter introduces Migration Center and explains how to install it. This chapter consists of the following sections:

- Overview
- System Requirements
- Installation and Uninstallation

Overview

Migration Center is a database migration tool that either directly or indirectly copies generally compatible database objects and data. Most databases comply with international standards, but no database is exempt from manual database migration. Generally, manual database migration is complicated, time-consuming, and error-prone. Migration Center helps users migrate databases with only a few mouse clicks in Graphic User Interface (GUI) mode, and offers Command Line Interface (CLI) mode as well.

The major benefits of using this tool are:

1. Database objects of the original database can be conveniently migrated to the target database (Alibase or Oracle) without any difficulties.
2. Directly copies data of a source database to Altibase with a JDBC driver (the most popular and widely available interface for DBMS nowadays).
3. Exports data to external files for later use in data importing to Altibase with iLoader.
4. Provides parallel execution options to shorten the migration process. By default, Migration Center automatically balances data migration load between a number of threads and also enables the user to manually split data over multiple threads.
5. Supports data type mapping of different data types between heterogeneous databases. Provides default type mapping for convenience and user-defined data type mapping for flexibility.
6. Provides GUI mode for better usability and CLI mode for special circumstances.
7. For schema migration, enables the user to modify DDL SQL statements for migrating database objects.

System Requirements

This section discusses the system requirements for Migration Center and compatible database management systems.

- Hardware Requirements
- Software Requirements
- Compatible Database Systems

Hardware Requirements

GUI Mode

- CPU: Pentium III 800MHz or better
- Main memory: 512MB or more
- Disk: 150MB or more free space
- Screen resolution: 1024x800 pixels or higher

CLI Mode

- CPU: Pentium III 800MHz or better
- Main memory: 512MB or more
- Disk: 150MB or more free space

Software Requirements

- Java Development Kit (JDK), or Java Runtime Environment (JRE) 8 or later

Migration Center is a pure Java application that uses Swing for GUI mode. It runs regardless of the user's hardware and operating system, but relies on the JRE. The user is recommended to install Oracle, or IBM Java 8 or later. To run Migration Center in GUI mode, the user's environment must support Java Swing.

Since Migration Center is bundled with the JRE 8 for the 64-bit Microsoft Windows system, these users do not need to install the JRE. However, other operating system users must configure the JRE and related environment variables appropriately.

Compatible Database Systems

Destination Database

- Altibase 6.5.1 or later

Source Database

- Altibase: 4.3.9 or later
- Oracle Database: 9i-11g
- Microsoft SQL Server: 2005-2012
- Oracle MySQL: 5.0-5.7
- Informix: 11.50
- Oracle TimesTen: 7.0, 11.2
- CUBRID: 8.4.1-9.3.5 (ISO-8859-1, UTF-8 charset)
- Tibero: 4sp1-6
- PostgreSQL: 9.5.3

JDBC Driver

Migration Center is available for different versions of Altibase and other databases. This tool uses a JDBC driver for database connection, so it is important to prepare the appropriate JDBC driver for both source and destination databases. For user convenience, some JDBC drivers that are appropriate for use with supported databases are provided with Migration Center.

Please note that for legal reasons, the Microsoft SQL Server JDBC driver file, MySQL Connector/J file, Informix JDBC Driver file, and TimesTen JDBC driver file are not included in the package. Also, since TimesTen only supports type 2 driver, the migration must be performed on a machine that the TimesTen Client Package is installed.

Users can download the appropriate JDBC driver file from the following site:

1. Microsoft does not support the JDBC driver for SQL Server 2005 according to the Microsoft Support Lifecycle(MSL) policy, and it also does not provide download link. Therefore, users should use the JDBC driver included in the database product they are using.
2. Microsoft JDBC Driver for SQL Server 2008, for 2008 R2, for 2012 can be downloaded from the link below. Since Migration Center has been tested with JDBC driver version 6.0 and JRE 7 environment, it is recommended for users to use the same driver version and JRE version. Also in Linux OS, the value of JAVA_HOME environment variable must be set to the path where the JRE 7 or later is installed. If you want to use a version other than JDBC Driver 6.0, you need to check the driver version, compatible SQL Server version, and supported JRE version in the Microsoft JDBC Driver for SQL Server Support Matrix.
Download Microsoft JDBC Driver for SQL Server:
<https://docs.microsoft.com/en-us/sql/connect/jdbc/download-microsoft-jdbc-driver-for-sql-server?view=sql-server-2017>
Microsoft JDBC Driver for SQL Server Support Matrix:
<https://docs.microsoft.com/en-us/sql/connect/jdbc/microsoft-jdbc-driver-for-sql-server-support-matrix?view=sql-server-2017>
3. Oracle MySQL Connector/J
<http://dev.mysql.com/downloads/connector/j/>
4. Informix JDBC Driver
<http://www14.software.ibm.com/webapp/download/search.jsp?go=y&rs=ifxjdbc>
5. Oracle TimesTen
<http://www.oracle.com/technetwork/database/database-technologies/timesten/downloads/index.html>
6. CUBRID
http://www.cubrid.org/?mid=downloads&item=jdbc_driver
7. Tibero
<https://technet.tmaxsoft.com/>

Installation and Uninstallation

Migration Center can be downloaded from [Altibase's Customer Center](#).

Migration Center is provided in zip or tar.gz file format. This file contains the executable file and some JDBC drivers.

To install, simply unzip the file. The generated directory contains the projects, lib, conf, and images subdirectories, other directories, and files (including migcenter.bat and migcenter.sh). Move this folder to a desired location, and Migration Center is ready for use.

To uninstall, simply delete the Migration Center directory.

2. Getting Started

This chapter describes the key concepts in migration, how to use Migration Center in GUI and CLI modes, and tools provided for user convenience.

This chapter consists of the following sections:

- Understanding Migration Center
- Understanding User Interface
- Tools

Understanding Migration Center

This section explains the terminology and overall process of Migration Center.

- Terms
- Basic Concept

Terms

Project

The Migration Center project is a basic work unit that describes all aspects of migration. This includes what to migrate, where from and where to migrate (namely, the database or datafile type), and how to migrate database objects and table data. For more detailed information about migration options, please refer to Appendix A: Migration Options. Only one project can be open at any time.

Basic Concept

The overall process of Migration Center consists of five steps: Prepare, Build, Reconcile, Run, and Data Validation.

Prepare Step

The Prepare step is an implicit step in the migration project. This step ends with an open project that has all database connections established. To get there, the user may need to add connection information of the running database, open an existing migration project, or create a new migration project by either using preconfigured database connections or establishing database connections.

Build Step

The Build step performs initial surveys on the current status of the source and destination databases. This step retrieves information about database objects in the source and destination databases through database connections, and saves this information in the project directory. Since this information is used in other steps, it must reflect the most recent status. If any metadata is changed in the source database prior to the Run step, the Build, Reconcile, and Run steps must be re-executed to integrate changes.

Reconcile Step

The Reconcile step builds a complete migration plan on the current status. This step is mostly 28 Migration Center User's Manual about making adjustments for differences between source and destination databases (namely, data types and tablespaces). This step enables the user to edit SELECT statements for fetching data from the source database and DDL statements to be executed on the destination database. For example, the user can specify which source database table is to be copied to which destination database tablespace.

Please remember that if changes are made to "Migration Options", this step must be re-executed.

Run Step

The Run step executes the plan built in the Reconcile step. This step migrates schema and data either directly or indirectly.

If the migration type in "Migration Options" is set to "DB to DB", Migration Center creates database objects in the destination database (schema migration). Then, it copies data from the source database to the destination database (data migration).

If the migration type in "Migration Options" is set to "DB to File," SQL script files are created during migration. Nevertheless, the basic migration process is the same.

Data Validation Step

The Data Validation step runs a check on migrated data. This step checks whether the data of a table that has a primary key and was migrated in the Run step is identical in the source and destination databases. If build step is performed as "Build User", this step checks the data validity of all tables that have a primary key. If build step is performed as "Build Table", this step checks the data validity of only migrated tables with a primary key.

Data that differs between the source and destination databases is stored to CSV files during this step. The user can apply data of this file to the destination database with the "FILESYNC" menu or command. To shorten the duration of this step, the data sampling feature is enabled by default. To disable the data sampling feature and run a data validation check on all data, select the "Data Validation Options" submenu from the "Migration Options" menu, and change "Data Sampling" to "No".

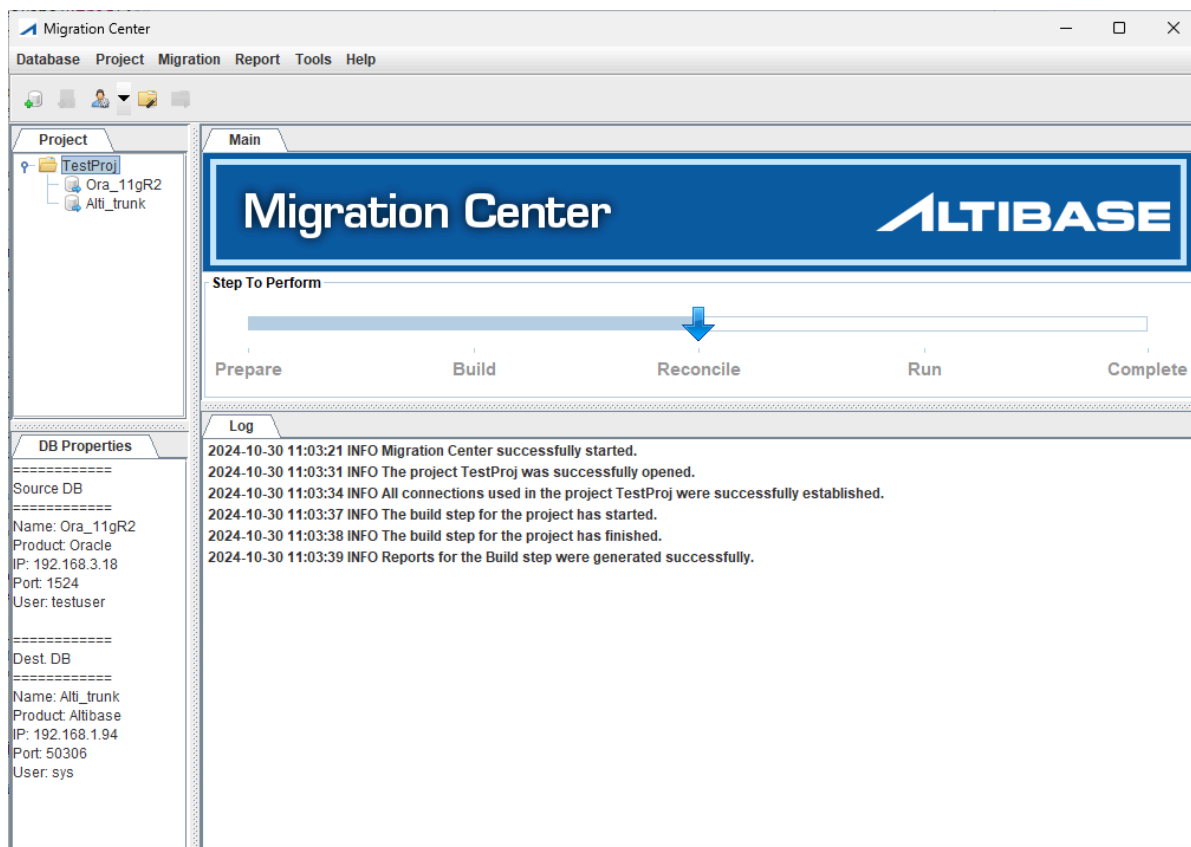

Understanding User Interface

This section briefly describes GUI mode and CLI mode provided by the Migration Center. The details of two mode usages are discussed at "GUI Mode Quick Guide" and "CLI Mode Quick Guide".

Graphic User Interface(GUI) Mode

GUI mode is a user-friendly interface and is the basic interface of Migration Center. GUI mode allows you to perform the entire migration process easily, and can be fine-tune "Reconciling the Project" step and changing the options. If the platform supports Java Swing from client computer to server, it can be executed in GUI mode.

The Migration Center GUI consists of the four panes shown below. Starting from the top left corner and moving clockwise, the four panes are Project, Information, Log, and DB Properties.

Project Pane

The Project pane offers a project-centric view. This pane displays the open project, and its source and destination database connections. Only one project can be open at a time.

Information Pane

The Information pane offers a simple view of the project. This pane displays the current progress and remaining steps.

Log Pane

The Log pane displays the results of tasks performed by Migration Center in chronological order. This pane chooses information that might be of interest to the user from logs stored in the log subdirectory under the Migration Center directory.

DB Properties Pane

The DB Properties pane displays information about the source and destination databases configured for the project.

Command Line Interface (CLI) Mode

The primary reason for using the CLI mode is to perform a fast "run" step. The "run" step, which takes the most time during the migration, creates the converted schema in the "Reconcile" step and migrates the data from the source database into the target database. Performing the "run" step in the CLI mode on the server where the database is installed, can increase the data transfer speed by reducing the communication cost compared to executing the "run" step in the GUI mode on the client computer.

Users can take advantage of both the convenience of GUI mode and the fast performance of CLI mode when you execute only the "Run" and "Validate" steps are performed in CLI mode after executing from "Start" to "Reconcile" in GUI mode.

Another reason to use in CLI mode is to perform the migration in an environment where GUI mode is not allowed. Although the entire migration process can be performed in CLI mode, it also has limitations of character-based interface. For example, user is allowed to perform "Reconcile" step only with the default value in CLI mode.

Tools

This section introduces how to use two types of utilities included in the Migration Center.

PSM Converter for File

"PSM Converter for File" converts Oracle PL/SQL to Altibase PSM in independent file units. This tool reads a SQL file that contains Oracle PL/SQL statements, converts it into Altibase PSM, and then writes the results in a predefined SQL file. This file is provided with an HTML formatted report file. This tool's functionality is equivalent to the PSM Converter in the Reconcile step. For more detailed information about conversion rules, please refer to PSM Converter Rule List.

To execute this tool, select "PSM Converter for File" from "Tools" in the main menu.

Generate Migration Error Report

"Generate Migration Error Report" reports problems that arise in Migration Center. If a project is opened, and this tool is executed, it collects problem tracking information (namely, log files and revision number information) and creates it as a zip file. The user only needs to attach the zip file to an email and send it to Altibase's Customer Support with the user's client registration information.

To execute this tool, select "Generate Migration Error Report" from "Tools" in the main menu.

3. GUI Mode Quick Guide

This chapter provides a quick step guide for users new to Migration Center.

Quick Step Guide for GUI User

The users can easily perform migration in GUI mode with this quick step guide. The overall process is listed below.

1. Start Migration Center
2. Prepare the project
 1. Register source and destination database connections
 2. Create a project
 3. Open the project
 4. Connect to source and destination databases
 5. Set migration options
3. Build the project
4. Reconcile the project
5. Run the project
6. Validate the project

Starting Migration Center

Double-click the “migcenter.bat” icon in the Migration Center folder on Microsoft Windows. Execute “migcenter.sh” on Unix-like operating systems. To use Migration Center on any environment other than a 64-bit version of Windows, please check that Java Runtime Environment (JRE) is installed, and that the PATH environment variable is set appropriately so that the JRE can be accessed from the terminal.

Registering a Database Connection

1. From the “Database” menu, select the “Add Database Connection” submenu, or click the “Add Database Connection” icon in the main toolbar.
2. Fill in all the input fields of the “Add Database Connection” dialog box:
 1. DB Product: The database system name
 2. Connection Name: A unique database connection name to be used for Migration Center projects
 3. IP: The Internet Protocol (IP) address of the database server
 4. Port: The port number of the database server or SSL port number of the Altibase server
 5. User: The valid user ID for the database
 6. Password: The password corresponding to the user ID for the database.
 7. JDBC Driver: The JDBC driver path to be used to connect to the database.
 8. Encoding: The default character set used on the client.
 9. IP Version: The IP protocol version used in this connection.

10. Property: The JDBC driver property to be used in this connection.

If connecting with SSL, set `ssl_enable = true` as shown below, and * `path_to_keystore`, `path_to_truststore`, and `password *` are set according to each authentication environment.

```
ssl_enable=true&keystore_url=path_to_keystore&keystore_password=password&truststore_url=path_to_truststore&truststore_password=password
```

3. Click the “Test” button at the bottom of the dialog box to check the input information before adding this connection to the connection list.
4. If the connection test is successful, click the “OK” button at the bottom of the dialog box to add the connection to the connection list. Then, close the “Add Database Connection” dialog box.

Creating the Project

1. From the “Project” menu, select the “Create Project” submenu, or click the “Create Project” icon in the main toolbar.
2. Fill in the input fields in the “New Project” dialog box:
 1. Project Name: A migration project name that is unique in Migration Center and meaningful to the user.
 2. Project Path: The folder path where migration project files will be stored. This value cannot be edited by users.
 3. Source Database: A database that contains database objects to be migrated in this project.
 4. Destination Database: An Altibase database to copy database objects from the source database and store them. This input field is mandatory, even if the project is configured for “DB to File” migration.
3. Click the “OK” button at the bottom of the “New Project” dialog box.

Opening the Project

To open a project, select the “Open Project” submenu from the “Project” menu. A file “Open” dialog box appears. The user only needs to choose a project folder and click the “Open” button.

Configuring the Project

The user can configure the project’s basic strategy prior to setting project details. For further information, please refer to Migration Options.

Connecting to Source and Destination Databases

Establishing connections with the source and destination databases is essential to proceed to the Build step. To connect the databases for the project, select the “Connect” submenu from the “Project” menu, or right-click the open project and click “Connect.”

Building the Project

The Build step is indispensable to migration, yet simple to execute.

1. Click "Build User" or "Build Table" from the "Migration" menu or the main toolbar.
2. A dialog box asking how to fetch records from each table in the source database appears. Select the desired method and click "OK". For further information about the available options and explanations thereof, refer to [Internal Activities](#).
3. If "Build Table" has been selected, a dialog box shows up to list the names of migration target tables. When clicking the "+" button, you can choose migration target tables with name search. After completing configuring the table list, click the "Build" button to proceed with the build step.
4. A "Build" dialog box displaying the build progress appears. At completion, a "Report" button appears at the bottom.
5. If you click "Report", an HTML report file is created in the project directory and the "Build Report" dialog box appears. This dialog box provides a link to the HTML report file. Once the "Report" button is clicked and an HTML report file is created, the "Build Report" submenu from the "Report" menu is activated. The user can open the "Build Report" dialog box at any time with this menu item.

Reconciling the Project

The Reconcile step is very important because it determines how to execute the Run step, and it requires some knowledge of both source and destination databases. For further information about this step, please refer to Migration Center Internals. The following is a simple guide:

1. From the "Migration" menu, select "Reconcile", or click the "Reconcile" icon in the main toolbar.
2. Change or confirm the default data type mapping.
3. Specify the Altibase tablespaces to which the source database is to be migrated.
4. Change or confirm how to migrate partitioned tables in the source database to Altibase.
5. Specify the Altibase tablespace to which each table or index in the source database is to be migrated.
6. Check the SELECT statement for fetching data from each table of the source database, and make changes if necessary.

Tip

When extracting data from the source database, users can selectively migrate only the data that meets specific conditions. Please refer to [5.Migration Center Internals - "Select Editing" Step](#) for more information.

7. Check whether the DDL SQL statements to be used during the schema migration process is correct, and make changes if necessary.
8. Click the "Report" button to generate a report for this step.

Running the Project

The Run step can be as easily executed as the Build step, but is irreversible. Please check all settings before proceeding any further.

1. From the "Migration" menu, select the "Run" submenu, or click the "Run" icon in the main toolbar.
2. Click "OK" in the warning dialog box to confirm that every configuration is correct.
3. Review the progress and final report closely.

Validating the Project

The Data Validation step checks whether data migration was properly performed in the Run step.

1. From the "Migration" menu, select the "Data Validation" submenu.
2. Click "OK" in the warning dialog box to confirm that every configuration is correct. The "Data Validation" dialog box appears and the Data Validation step is executed.
3. At completion, a "Report" button appears at the bottom.
4. If you click "Report", an HTML report file is created in the project directory and the "Data Validation Report" dialog box appears. This dialog box provides a link to the HTML report file. Once the "Report" button is clicked and an HTML report file is created, the "Data Validation Report" submenu from the "Report" menu is activated and the user can open the "Data Validation Report" dialog box at any time with this submenu.
5. If there is a difference between the data of the source and destination databases in the report, the user can synchronize the data with the filesync feature.

The following is a simple guide for using filesync.

1. From the "Migration" menu, select the "Migration Options" submenu.
2. Click "OK" in the warning dialog box.
3. Select "FILESYNC" in the "Operation" combo box from the "Data Validation Options" submenu, and click "OK".
4. From the "Migration" menu, select the "Reconcile" submenu, or click the "Reconcile" icon in the main toolbar.
5. Select "Table Mode" in the dialog box that appears.
6. Select the table to perform data synchronization on.
7. Click "Next" until the Reconcile step completes.
8. From the "Migration" menu, select the "Data Validation" submenu.
9. The "Data Validation" dialog box appears and filesync is executed. At completion, a "Report" button appears at the bottom.
10. Check that data difference has been solved in the report.

4. CLI Mode Quick Guide

This chapter provides a quick step guide for CLI mode users who are new to Migration Center.

Quick Step Guide for CLI User

The user can easily perform migration in CLI mode with this quick step guide. The overall process is listed below.

1. Prepare the project
 1. Register database connection information and project
 2. Set migration options
2. Build the project
3. Reconcile the project
4. Run the project
5. Validate the project

Prepare the Project

The source/destination database connection information and project registration are essential to perform migration. It is possible to register the project in CLI mode, but it is recommended to register in user-friendly in GUI mode.

To register the database connection information and projects in CLI mode, you must explicitly register it in Migration Center after modifying the registration file(register.xml). What you need to input in the registration file is the project name and the source / destination database connection information to be used in the project. Multiple projects can be registered at once.

The registration file must be located in the directory where the Migration Center is installed. Please refer to the comments and samples in the "register.xml" file for more details.

Registering database connection information and project

```
% ./migcenter.sh register register.xml
```

The source/destination database connection information and the project recorded in the registration file (register.xml) is to be registered in the Migration Center. The input project name should be unique, and the database connection information should be able to connect to the target database before registrations. When the project is successfully registered, the project name folder is automatically created and source/destination database connect information is stored in Migration Center.

If either the project recorded in the registration file or the registration of the database connection information fails, all project and database connection registration recorded in the registration file are canceled.

The user can use a name other than "register.xml" as the name of the registration file.

Setting Migration Options

The "options.xml" file is automatically created in the project folder when the project is registered. You can modify the options in the options.xml file directly in CLI mode. For details of the options, refer to the "Appendix A: Migration Options".

Building the Project

```
% ./migcenter.sh build project_path
```

To perform the "Build" step, input the build command and the path of the target project. The number of table records in the source database is collected using the Approximate Counting Method by default.

Reconciling the Project

```
% ./migcenter.sh reconcile project_path
```

To perform the "Reconcile" step, input the reconcile command and the path of the target project. In CLI mode, user is not allowed to tune the "Reconcile" step due to the limit of character-based interface.

Tip

When extracting data from the source database, users can selectively migrate only the data that meets specific conditions. Please refer to [5.Migration Center Internals - "Select Editing" Step](#) for more information.

Running the Project

```
% ./migcenter.sh run project_path
```

To perform the "Run" step, input the run command and the path of the target project.

Validating the Project

```
% ./migcenter.sh diff project_path
```

To verify the data migrated properly in the "Run" step, input the diff command and the path of the target project.

```
% ./migcenter.sh filesync project_path
```

To match the different data between the source and destination databases using the diff command, input filesync command and the path of the target project.

5. Migration Center Internals

This chapter describes the main steps of Migration Center, namely the Build, Reconcile, Run, and Data Validation steps. This chapter consists of the following sections:

- Build Step
- Reconcile Step
- Run Step
- Data Validation Step

Build Step

Purpose

The Build step not only collects information about database objects from the source and destination databases, but also provides a build report to make migration easier for the user. The report lists migratable database objects in the source and destination databases with byte size information. This informs the user of the scale of the migration project, and helps the user to estimate the necessary data volume and time.

The information gathered in this step is used throughout the entire migration process and must reflect the current status of the source and destination databases. If changes are made to the database objects in the source database after the Build step, all steps must be re-executed.

Output

- Build reports
Several data volume analysis reports based on the current status of the source and destination databases are output in HTML format and stored in the project folder.
- SQL Data Definition Language (DDL) script
A file containing database object creation statements (DDLs) collected from the source database, whether or not Migration Center is supported, created in the project folder and named SrcDbObj_Create.sql. This file is intended for user reference only and is not used at any stage of the Migration Center.
- BuildReport4Unsupported.html
It is one of the files summarizing the build results and shows the CREATE statements of objects not automatically migrated by the Migration Center. Objects that are not supported by Migration Center must be manually converted by the user, and this file can be referenced for conversion operations.
Non-automatic migration object types depend on the source database and can be found at [Appendix B: Migratable Database Objects](#). In case of Oracle to Altibase migration, this file is not created because all of Oracle database object types defined in the appendix table are supported for automatic migration. On the other hand, in case of MySQL to Altibase migration, if the source database has any database object type such as stored procedures, stored functions, views, and trigger objects, the CREATE statement of the unsupported database object is recorded at this file for user's reference.

Internal Activities

This step consists of two internal activities; collecting information about database objects from both databases, and generating a Build report based on that information.

The collecting information can be started as either "Build User" or "Build Table".

- **Build User**
This collects all migratable object information of the user connected to the source database
- **Build Table**
This configures a list of tables to be migrated among the tables of the user connected to the source database. Plus, this collects object information of the selected tables, and constraints and indexes dependent on the selected tables.

For more information on the object types that can be migrated, refer to the "Appendix B: Migratable Database Objects".

When the user starts the build step, the "Table Counting Method" dialog box appears. The user can choose one of the following options:

- **Approximate Counting Method**
This retrieves the number of table records by referring to the statistical value of the source database. This value is affected by the accuracy of the statistical value.
- **Exact Counting Method**
This retrieves the exact number of table records by executing the COUNT function on every table in the source database.

Of the two methods, the approximate counting method performs faster whereas, the exact counting method yields more accurate results.

The method chosen does not affect the database schema and data migration. It only affects the accuracy of the data migration progress percentage provided at the Run step in GUI mode. This is because the data migration progress is displayed as the time elapsed and the percentage of (number of migrated records / total number of records). With this, the user can estimate the total amount of time required to complete data migration.

For more detailed information about how to execute the Build step, please refer to [Building the Project](#).

Reconcile Step

Purpose

The Reconcile step builds a migration plan. Migration Center users should have a plan on how to migrate the database objects of each database. Migration Center cannot migrate all database objects to Altibase databases. However, it makes migration easier by allowing users full control over migration.

Altibase offers high performance of an in-memory database and high capacity of on-disk database in a single database. Altibase generally stores frequently used and low-latency data in memory tablespaces, and the rest of the data in disk tablespaces.

For more detailed information about tablespaces in Altibase databases, please refer to the *Administrator's Manual*.

Output

- Reconcile reports: Several reports that specify which database objects to migrate and how to migrate them in the project folder.
- SQL Data Definition Language (DDL) scripts: Sample SQL files to create and drop database objects in the destination database are provided in the project folder for user convenience. However, these files are not used in any step.
 - DbObj_Create.sql: A SQL script file for creating database objects to be migrated.
 - DbObj_Drop.sql: A SQL script file for dropping database objects having the same names as those to be migrated.
- PL/SQL conversion reports: Several reports generated by the PL/SQL Converter.
 - sqlconv.html: A HTML report that compares the difference between source and converted PL/SQL.
 - sqlconv_src.sql: A report that contains the input PL/SQL statements to be converted in text format.
 - sqlconv_dest.sql: A report that contains converted PL/SQL statements and comments listing the applied conversion rules in text format.

Internal Activities

Although the Reconcile step is very important and can get complicated, the wizard is as easy to use as a UI. For further information about how to start the Reconcile step, please refer to [Reconciling the Project](#) in Chapter 3.

Reconcile Wizard Dialog Box

Users can check and modify the default settings in wizard dialog box. The wizard guides the user step by step, but the user can also go to any step by selecting it in the left pane.

“Data Type Mapping” Step

The “Data Type Mapping” step maps data types between heterogeneous databases. Please note that small differences between data types can cause unexpected data loss and truncation during data migration. For more detailed information, please refer to Data Type Mapping in Appendix C.

“PSM Data Type Mapping” Step

The “PSM Data Type Mapping” step maps PSM data types between heterogeneous databases. This step is only activated for Oracle to Altibase PSM Migration or TimesTen to Altibase PSM Migration. All configurations specified in this step are reflected to target DDL in the “SQL Editing” step later on.

“Tablespace to Tablespace Mapping” Step

The “Tablespace to Tablespace Mapping” step maps tablespaces between the source and destination databases. When tablespace mapping is set, contents of the tablespace are also mapped to the selected tablespace. This step creates a default tablespace map, and this map can be altered with the “Object to Tablespace Mapping” submenu.

"Object to Tablespace Mapping" Step

The "Object to Tablespace Mapping" step maps each table and index by dragging and dropping them to tablespaces in the destination tablespace. Whenever a map changes, the necessary total storage sizes for tablespaces in the destination database are recalculated. Internally, a database object size is accurately retained in bytes, but is rounded to megabytes in the dialog box. Therefore, the total size of a tablespace may not be equivalent to the sum of its contents.

"Select Editing" Step

The "Select Editing" step enables the user to edit the SELECT statement for fetching data from a table in the source database. The user can add hints or WHERE clauses, and immediately check the edited statement. Click the "Restore" button to undo changes.

The name of modified table in the SELECT statement is recorded in pairs with WHERE clause in the TableCondition.properties file. This file is automatically generated during the final stage of Reconcile, and it can be edited by the user.

TableCondition.properties

To selectively migrate specific data from tables in the source database, the "TableCondition.properties" file is provided. Users can input conditions in this file to filter data for migration. Tables not included in this file will have all data migrated from the source to the target tables.

The file is structured with "Source Database Table Name"=WHERE clause pairs, and it is automatically generated after completing the Reconcile step. The WHERE clauses in this file are added to SELECT statements when retrieving data from the source tables. Additionally, the same WHERE clause is used when verifying the number of migrated records in the target table after Execution step. The number of migrated data can be viewed in the RunReport4Summary.html file.

Conditions can be modified during the Reconcile step using "Select Editing" or manually edited after Reconcile step is complete, with the following constraints:

- The WHERE clause must be written on a single line.
- If there are SQL syntax differences between the source and target databases, the [DEST] section should include the WHERE clause for the target database table.
 - Example

```
DATE_TEST=WHERE C2 > DATE '2023-12-02 '
...
[DEST]
DATE_TEST=WHERE C2 > TO_DATE('2023-12-02', 'YYYY-MM-DD');
```

Refer to the guidance at the top of the file for more details on editing and restrictions.

"Unacceptable Name" Step

The "Unacceptable Name" step shows objects that violate the unquoted object name rules in the target database. This includes objects with special characters or spaces in the name, and creation fails during the run step. If the user selects the "Use Double-quoted Identifier" check box, the user can avoid creating objects by wrapping only the problem names in double quotes("").

“SQL Editing” Step

The “SQL Editing” step allows the user to view and edit the DDL statements for schema migration. The user can refer to the source DDL, and directly edit the DDL statements that Migration Center will apply on the destination database. SQL statements for creating procedures, functions, triggers, and views are all displayed in PSM type.

Tick the check box to select which object type within the PSM category to edit. These objects are displayed in the “Done” or “To-Do” list pane. If an object requires user confirmation, it is displayed in the todo list; otherwise, it is displayed in the done list. Click an object name in a list to view its source and destination DDL. Edit the DDL statement of an object belonging to the to-do list, then click the “Save” button, and the object will move to the done list.

The migration of an object in the done list can unexpectedly fail in the Run step. In this case, the user must check the “Missing Cause” in the Run report, find the error cause, and manually migrate the object.

DDL statements of PSM objects can be output as a file for users who prefer text editors. This functionality and instructions on its use are provided in the offline pane of the PSM object type. For Oracle or TimesTen to Altibase migration, the PL/SQL Converter converts the DDL statement of the PSM type object to an Altibase-compatible format.

Please note that although most of the syntax is converted, statements containing semantic logic are not converted.

Caution

Migration Center generates a dependency graph between objects in the source and destination databases in the Build step. If the user changes this dependency while editing destination DDL statements, migration cannot be guaranteed for the object and related objects.

Run Step

Purpose

The Run step copies database objects in the source database to the destination database or external files, depending on migration options.

After the Run step is complete, Run reports that contain results of this step are generated. These results may be the most important to the user. The RunReport4Summary.html report file outputs the overall result by comparing the number of database objects and table records in the source and destination databases. The RunReport4Missing.html report file outputs in detail any failure.

Data that failed to be migrated is collected in the “db2db” or “db2file” folder in the project folder. These two folders store data files and form files available for use with iLoader (the command-line data import/export tool for Altibase databases), and also scripts to easily import the generated data files to the database with iLoader. “iLoaderIn.sh” is the main script that executes the “iLoaderIn.number.sh” script which runs iLoader on other script files and tables.

Output

- RunReport4Summary.html: A summary report file that outputs the overall result of migration.

- `RunReport4Missing.html`: A missing report file that outputs information about data that failed to be migrated, and the error cause.
- `DbObj_Failed.sql`: A file that outputs a list of failed SQL statements and the error cause.
- The `db2db` folder: A subfolder in the project directory, where data that failed to be migrated is saved. This folder is only available if the “DB to DB” option is selected for “Migration Type” and “No” is selected for “Batch Execution.”
- The `db2file` folder: A subfolder in the project directory, where all output is saved if the “DB to File” option is selected for “Migration Type”.

Internal Activities

The user can execute the Run step with a single mouse click in GUI mode, or a single command in CLI mode. For further information, please refer to [Running the Project](#) in Chapter 3 or Chapter 4.

Internally, this process consists of three steps to avoid database object dependencies: Initialization, the PreSchema, Table & Data, and PostSchema steps. For example, index objects are migrated in the PostSchema step, after the Table & Data step is completed. This is because it is usually faster to insert data without an index, than with an index.

Each step performs the following:

1. Initialization: To the source database, performs validation of the WHERE clauses recorded in the `TableCondition.properties` file.
2. PreSchema: Migrates sequence objects
3. Table & Data: Migrates table objects and data
4. PostSchema:
 1. Queue: Migrates queue objects
 2. Constraints: Migrates constraints, namely unique, primary key, foreign key, and check constraints
 3. Index: Migrates index objects
 4. Synonym: Migrates private synonym objects
 5. Procedures, functions, materialized views, views, typesets and triggers: Depends on the database management system and its version

Data Validation Step

Purpose

The Data Validation step checks whether data migration was properly performed in the Run step. At completion, the user is provided with a Data Validation report for post processing. This report offers information about the source and destination databases, a list of successfully validated tables, and the number of occurrences of data accordance and difference.

The user can decide whether to re-execute the Run step or use `filesync`. The user is recommended to use `filesync` when the occurrence of data difference is low, but re-execute the Run step when the occurrence of data difference is high.

Restrictions

- The Data Validation step can only be performed on a table with a primary key constraint.
- LOB columns are excluded as targets for data comparison.

Output

- Data Validation report: A report containing a summary with information, namely the list of validated tables and the occurrences of data accordance and difference is output to the project directory.
- Validation directory: A subdirectory in the project directory that stores different data. This directory is valid only if “YES” is selected for the “Write to CSV” option in the “Data Validation Options” submenu.

Internal Activities

The Data Validation step can be executed with a single click in GUI mode, or a single command in CLI mode. For further information, please refer to Validating the Project or Executing the Run and Data Validation Steps in CLI Mode.

Internally, the Data Validation step is executed as below.

The data to be validated is fetched from the source and destination databases and compared. If a difference in data is detected and “Write to CSV” in the “Data Validation Options” submenu is set to “Yes”, the different data is stored in CSV format files in the validation folder. Regardless of the option, summary information is always output to the Data Validation report.

Appendix A: Migration Options

Migration Options affect the migration project. They can be edited by selecting the “Migration Option” menu item from the Migration menu in GUI mode. Migration Options can usually be edited right after the project is created.

The primary option is the Migration Type: either “DB to DB” or “DB to File”.

- DB to DB Migration Options
- DB to File Migration Options

DB to DB Migration Options

Object and table data of the source database to be migrated are migrated directly to the database (Altibase) to be stored.

Name	Description
Execution Thread	Specifies the maximum number of threads to be used when executing data migration. The default value is triple of the number of logical processors in the system running the Migration Center. The suggested range of this value is from 1 to triple of the number of logical processors in the system running the Migration Center.
Migration Target	Specifies the targets for migration: - Object & Data: Database objects and table data - Object: Database objects only
Object Options	
Foreign Key Migration	Specifies whether or not to include foreign key constraints in migration target. This option is set to 'No' by default.
PSM Migration	Specifies whether or not to include PSM objects such as procedures, functions, materialized views, views, typesets, and triggers in migration target. This option is set to 'No' by default.
Drop Existing Objects	Specifies whether or not to recreate the database object before migration. When this option is set to 'Yes', DROP and CREATE will be executed on migration target objects in target database. When this option is set to 'No', migration will be executed without dropping the database objects. This option is set to 'No' by default.
Keep Partition Table	Specifies whether or not to maintain partitioned tables. When this option is set to 'Yes', partitioned tables in the the source database will be migrated as partitioned tables. In this case, additional work is required for the partitioned tables in the reconcile stage's '5. Partitioned Table Conversion'. When this option is set to 'No', target partitioned tables will be migrated as non-partitioned tables. This option is set to 'No' by default.

Name	Description
Use Double-quoted Identifier	Specifies whether or not to use double quotation marks for schema and object names. This option is set to 'No' by default.
Remove FORCE from View DDL	Specifies whether or not to remove 'FORCE' keyword from the statement creating a view.
Postfix for reserved word	Specifies a user-defined word which is to be added to the database object name in the source database as a postfix when it conflicts with a reserved keyword of Altibase. The default value is _POC.
Default " (Empty String) Not Null Column	<p>Defines how to modify the column definition when an empty string¹ is set as the default value and a NOT NULL constraint is applied</p> <ul style="list-style-type: none"> - Replace Default Empty String: Setting this option to 'Yes' allows to replace the default empty string with a user-defined value. The default setting is 'No'. - Replacement Default Value: Specifies the string to be used as the new default value. This option is only enabled when Replace Default Empty String is set to 'Yes'. - Remove Not Null: Setting this option to 'Yes' removes the NOT NULL constraint from the column where the empty string is the default value. The default setting is 'No'.
Data Options	
Batch Execution	Specifies whether or not to use batch insert in JDBC for higher performance. This option is set to 'Yes' by default.
Batch Size	Specifies the batch size when batch insert in JDBC is used. The default value is 10,000.
Batch LOB type	Specifies whether or not to batch process BLOB and CLOB data types. 'Yes' means to allow batch processing. However, it should be noted that problems such as out of memory (OOM) may occur depending on the size of the LOB data. Also, an exception may be raised in TimesTen, which does not support the batch processing for LOB data types. 'No' does not allow batch processing. This option is set to 'No' by default.
Log Insert-failed Data	Specifies whether or not to log insert-failed rows during data migration. This option is available only when the Batch Execution option is disabled. This option is set to 'No' by default.
File Encoding	Specifies the encoding character set to be used when logging the insert-failed data into files. This option is available only when the Log Insert-failed Data option is enabled. The default value is UTF8.

Name	Description
Replace Empty String Data	<p>Specifies how to replace empty string data encountered during data migration with a user-defined string.</p> <ul style="list-style-type: none"> - Replace Empty Strings in Not Null: Setting this option to 'Yes' allows to replace empty string data with a user-defined string. The default setting is 'No'. - Replacement String: Specifies the string that will replace the empty string. This option is only enabled when Replace Empty Strings in Not Null is set to 'Yes'. - Apply to Nullable Columns: Setting this option to 'Yes' allows to replace empty string data in columns without a NOT NULL constraint with the value specified in Replacement String. The default setting is 'No'.
Data Validation Options	
Operation	<p>Specifies the operation to be executed in the data validation stage:</p> <ul style="list-style-type: none"> - DIFF: Check data difference between the source and the target databases. - FILESYNC: Apply the CSV file created as a result of DIFF operation to the target database.
Write to CSV	Specifies whether or not to write the inconsistent data to the CSV file.
Include LOB	Specifies whether or not to include LOB data when writing inconsistent data to the CSV file.
Data Sampling	<p>Specifies whether or not to use data sampling feature.</p> <p>When this option is set to 'Yes', to decrease the data validation time, only sample data will be validated. When this option is set to 'No', each data will be validated. This option is set to 'Yes' by default.</p>
Percent Sampling (exact counting)	<p>Specifies the percentage of data to be sampled from target tables.</p> <p>This option is used only when the Exact Counting Method is selected in the build stage.</p>
Record Count Sampling (approximate counting)	<p>Specifies the number of records to be sampled from target tables.</p> <p>This option is used only if the Approximate Counting Method is selected in the build stage.</p>

DB to File Migration Options

Object and table data of the source database to be migrated are stored as SQL script file, form file, and CSV type data file, respectively.

The stored files can be migrated to the database (Altibase) to be saved using iSQL and iLoader.

Name	Description
Execution Thread	Specifies the maximum number of multi thread to be used when executing data migration. Default value is triple of the amount logical processors in the system running the Migration Center. The suggested range of this value is from 1 to triple of the amount logical processors in the system running the Migration Center.
Migration Target	Specifies the targets for data migration: - Object & Data: Database objects and table data - Object: Database objects only
Object Options	
Foreign Key Migration	Specifies whether or not to include foreign key constraints in migration target. This option is set to 'No' by default.
PSM Migration	Specifies whether or not to include PSM objects such as procedures, functions, materialized views, views, typesets, and triggers. This option is set to 'Yes' by default.
Keep Partition Table	Specifies whether or not to maintain partitioned tables. When this option is set to 'Yes', partitioned tables in the the source database will be migrated as partitioned tables. In this case, additional work is required for the partitioned tables in the reconcile stage's '5. Partitioned Table Conversion'. When this option is set to 'No', target partitioned tables will be migrated as non-partitioned tables. This option is set to 'No' by default.
Use Double-quoted Identifier	Specifies whether or not to use double quotation marks for schema and object names. This option is set to 'No' by default.
Default " (Empty String) Not Null Column	Defines how to modify the column definition when an empty string is set as the default value and a NOT NULL constraint is applied - Replace Default Empty String: Setting this option to 'Yes' allows to replace the default empty string with a user-defined value. The default setting is 'No'. - Replacement Default Value: Specifies the string to be used as the new default value. This option is only enabled when Replace Default Empty String is set to 'Yes'. - Remove Not Null: Setting this option to 'Yes' removes the NOT NULL constraint from the column where the empty string is the default value. The default setting is 'No'.
Data Files	
File Encoding	Specifies the encoding character set to be used for scripts and data files.

Appendix B: Migratable Database Objects

This section will provide guidelines and explanation in regards to the migratable database objects depending on the "Build" step.

Objects in the source database that Migration Center does not migrate automatically must be converted manually by the user. Starting with Migration Center 7.11, the CREATE statement of an object is written to the two files below in the Build step, so users can refer to these files for conversion.

- SrcDbObj_Create.sql
- BuildReport4Unsupported.html

Altibase to Altibase

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Table	O	O	The comments specified in the tables and columns are migrated as well.
Primary Key Constraint	O	O	
Unique Constraint	O	O	
Check Constraint	O	O	
Foreign Key Constraint	O	O	
Index	O	O	
Sequence	O	X	
Queue	O	X	
Private Synonym	Partly yes	X	Synonyms that refer to objects in other schemas are also migrated
Procedure	Partly yes	X	The original DDL statement is performed without any additional conversion.
Function	Partly yes	X	The original DDL statement is performed without any additional conversion.

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Package	Partly yes	X	The original DDL statement is performed without any additional conversion.
View	Partly yes	X	The original DDL statement is performed without any additional conversion.
Materialized View	Partly yes	X	The original DDL statement is performed without any additional conversion.
Trigger	Partly yes	X	The original DDL statement is performed without any additional conversion.

CUBRID to Altibase

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Table	O	O	The comments specified in tables and columns are migrated as well.
Primary Key Constraint	O	O	
Unique Constraint	O	O	
Foreign Key Constraint	O	O	
Index	O	O	Reverse index and Prefix length index of CUBRID are not supported in Altibase. Since the reverse index takes a method of reversely inserting key values when creating an index, it is not supported by Altibase migration whereas prefix length index takes a method of partially indexing specific key values and so, it is converted as a general index in Altibase when migrating.
auto_increment Column Attribute	O	O	it is migrated to the sequence.

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Serial	O	X	It is migrated to the sequence.
Procedure	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.
Function	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.
View	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.
Trigger	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.

Informix to Altibase

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Table	O	O	The comments specified in tables and columns are migrated as well.
Primary Key Constraint	O	O	
Unique Constraint	O	O	
Check Constraint	O	O	
Foreign Key Constraint	O	O	

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Index	O	O	
Serial Column Type	O	O	It is migrated to the sequence.
Sequence	O	X	
Private Synonym	Partly yes	X	Only synonyms that refer to objects in the same schema are migrated.
Procedure	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.
Function	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.
View	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.
Trigger	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.

MySQL to Altibase

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Table	O	O	The comments specified in tables and columns are migrated as well.
Primary Key Constraint	O	O	
Unique Constraint	O	O	

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Check Constraint	O	O	
Foreign Key Constraint	O	O	
Index	O	O	
auto_increment Column Attribute	O	O	It is migrated to the sequence.
Procedure	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.
Function	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.
View	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.
Trigger	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.

Oracle to Altibase

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Table	O	O	To migrate a temporary table from an Oracle database(source database) to Altibase(destination database), a volatile tablespace is required in Altibase. This is because an Altibase temporary table can only be created in a volatile tablespace. Also, the comments specified in tables and columns are migrated as well.
Primary Key Constraint	O	O	
Unique Constraint	O	O	
Check Constraint	O	O	
Foreign Key Constraint	O	O	
Index	O	O	
Sequence	O	X	
Private Synonym	Partly yes	X	Only synonyms that refer to objects in the same schema are migrated.
Procedure	Partly yes	X	Converts object creation statements according to the rules defined in the PSM converter and attempts migration.
Function	Partly yes	X	Converts object creation statements according to the rules defined in the PSM converter and attempts migration.
Package	Partly yes	X	Converts object creation statements according to the rules defined in the PSM converter and attempts migration.
View	Partly yes	X	Converts object creation statements according to the rules defined in the PSM converter and attempts migration.
Materialized View	Partly yes	X	Converts object creation statements according to the rules defined in the PSM converter and attempts migration.

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Trigger	Partly yes	X	Converts object creation statements according to the rules defined in the PSM converter and attempts migration.

SQL Server to Altibase

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Table	O	O	The comments specified in tables and columns are migrated as well.
Primary Key Constraint	O	O	
Unique Constraint	O	O	
Check Constraint	O	O	
Foreign Key Constraint	O	O	
Index	O	O	
Identity Column Attribute	O	O	It is migrated to the sequence
Sequence	O	X	SQL Server 2012 Support
Private Synonym	Partly yes	X	Only synonyms that refer to objects in the same schema are migrated.
Procedure	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.
Function	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
View	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.
Trigger	X	X	In the build step, the object creation statements collected from the source database are recorded in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.

TimesTen to Altibase

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Table	O	O	To migrate a temporary table from an TimesTen database(source database) to Altibase(destination database), a volatile tablespace is required in Altibase. This is because an Altibase temporary table can only be created in a volatile tablespace. Also, the comments specified in tables and columns are migrated as well.
Primary Key Constraint	O	O	
Unique Constraint	O	O	
Foreign Key Constraint	O	O	

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Index	O	O	The index ordering(ASC/DESC) or size of TimesTen(source database) is not provided. Thus, the index ordering is set as the default value(ASC), and the size is not displayed when migrating. Among the three indexes(hash, range, bitmap) provided by Times ten, the hash•range index is converted into B-tree index of Altibase and the bitmap index is skipped when migrating. Furthermore, if the indexed column has unique constraints or is the primary key, the target index migration fails since Altibase does not allow creating an index on those constrained column(s). A list of nonmigratable indexes that are filtered during the build step can be found in the Missing tab of the Build Report.
Sequence	O	X	
Private Synonym	Partly yes	X	Only synonyms that refer to objects in the same schema are migrated.
Procedure	Partly yes	X	TimesTen 11.2 support
Function	Partly yes	X	TimesTen 11.2 support
Package	Partly yes	X	TimesTen 11.2 support
View	Partly yes	X	TimesTen 11.2 support
Materialized View	Partly yes	X	TimesTen 11.2 support
Trigger	Partly yes	X	TimesTen 11.2 support

Tibero to Altibase

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Table	O	O	To migrate a temporary table from an Tibero database(source database) to Altibase(destination database), a volatile tablespace is required in Altibase. This is because an Altibase temporary table can only be created in a volatile tablespace. Also, the comments specified in tables and columns are migrated as well.
Primary Key Constraint	O	O	
Unique Constraint	O	O	
Check Constraint	O	O	
Foreign Key Constraint	O	O	
Index	O	O	Indexes created automatically in Tibero's LOB type column are not supported by Altibase and can not be migrated. A list of nonmigratable indexes that are filtered during the build step can be found in the Missing tab of the Build Report.
Sequence	O	X	
Private Synonym	Partly yes	X	Only synonyms that refer to objects in the same schema are migrated.
Procedure	Partly yes	X	Converts object creation statements according to the rules defined in the PSM converter and attempts migration.
Function	Partly yes	X	Converts object creation statements according to the rules defined in the PSM converter and attempts migration.
Package	Partly yes	X	Converts object creation statements according to the rules defined in the PSM converter and attempts migration.

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
View	Partly yes	X	Converts object creation statements according to the rules defined in the PSM converter and attempts migration.
Materialized View	Partly yes	X	Converts object creation statements according to the rules defined in the PSM converter and attempts migration.
Trigger	Partly yes	X	Converts object creation statements according to the rules defined in the PSM converter and attempts migration.

Note

Migration Center uses the SQL parser for Oracle provided by Third Party to migrate Tiberio's Procedure, Function, View, Materialized View, and Trigger objects. Therefore, objects created with Tiberio native syntax that is incompatible with Oracle grammar can cause parsing errors during conversion. In this case, the user must manually translate the syntax.

PostgreSQL to Altibase

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Table	O	O	The comments specified in columns are migrated. Since the maximum number of columns that can be created in a table is 1,600 for PostgreSQL, and 1,024 for Altibase, must be careful when performing migration.
Primary Key Constraint	O	O	
Unique Constraint	O	O	
Check Constraint	O	O	

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Foreign Key Constraint	O	O	<p>CASCADE, NO ACTION, and SET NULL options are migrated by using the same options both source and destination databases.</p> <p>When migrating, the RESTRICT option is deleted. This is because the operation of the RESTRICT option is the same as when there is no foreign key option in Altibase. Since the SET DEFAULT option is not supported by Altibase, it is converted to SET NULL during migration.</p>
Index	O	O	<p>Among the various index types of PostgreSQL, only B-tree and R-tree supported by Altibase are subject to migration.</p>
Sequence	O	X	<p>The default maximum value of 9223372036854775807 in the PostgreSQL sequence is coerced to the default maximum value of 9223372036854775806 in the Altibase sequence.</p> <p>If the cache size of the PostgreSQL sequence is 1, Altibase deletes the CACHE clause and creates it with Altibase's default cache size of 20.</p> <p>Sequences explicitly created by the user in 'Build Table' are excluded from the migration target, but sequences that be created for Serial data type of the migration target table column are migrated along with the table.</p>
Function	X	X	<p>Migration is not supported. Record the object creation statements collected from PostgreSQL at the Build stage in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.</p>
View	X	X	<p>Migration is not supported. Record the object creation statements collected from PostgreSQL at the Build stage in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.</p>

Database Object Type	Migratable in 'Build User'	Migratable in 'Build Table'	Remarks
Materialized View	X	X	Migration is not supported. Record the object creation statements collected from PostgreSQL at the Build stage in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.
Trigger	X	X	Migration is not supported. Record the object creation statements collected from PostgreSQL at the Build stage in the SrcDbObj_Create.sql and BuildReport4Unsupported.html files.

Note

PostgreSQL objects not recorded in the above table(e.g., Exclusion constraints, Types, Enums, etc.) are excluded from the migration target because there are no objects corresponding to Altibase.

Appendix C: Data Type Mapping

Migration Center's policy for mapping data types between heterogeneous databases is to minimize the loss of data. However, the user may wish to customize the way that data is mapped, even if it incurs the loss or corruption of data. To satisfy this requirement, Migration Center also allows the user to edit the data type mapping table.

This chapter explains how to check and customize the default data type mapping table during the project progress of the Migration Center. It also explains the precautions that users need to know in the Migration Center's default data type mapping table.

Manipulating Data Type Mapping

The user can change the data type mapping table in the reconcile stage as shown below.

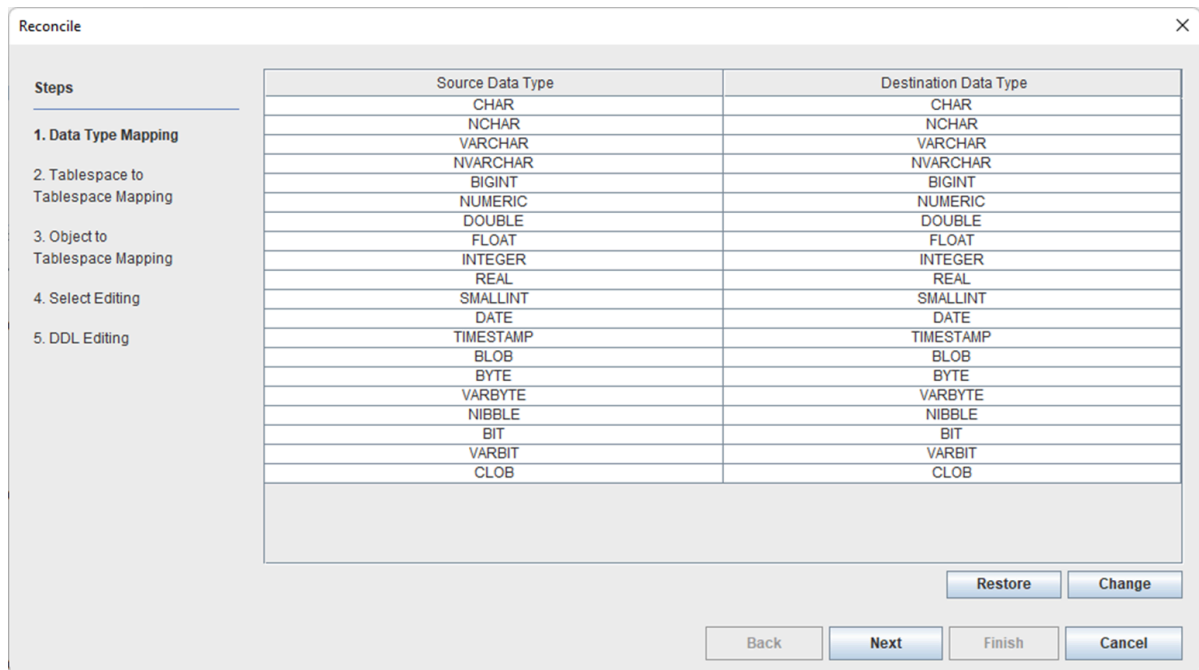

1.Reconcile

Right-click in the project tree window and select the Reconcile menu. Or select Reconcile from the Migration menu. You must complete the Build step before you can perform this step.

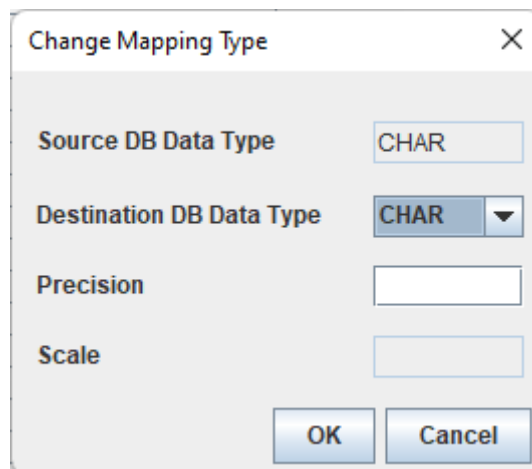

2. Data Type Mapping

Reconcile menu is clicked, the Reconcile window appears as shown below. In this window, users can view the default data type mapping table of Migration Center and change the data type of the target database in "1. Data Type Mapping". Select the data type you want to change and click the *Change* button at the bottom right.

3. Change Mapping Type

Change button is clicked, the following window appears. In the "Change Mapping Type" window, select the data type to change in the Destination DB Data Type. Depending on the data type, enter Precision and Scale if necessary, and click the *OK* button.

Default Data Type Mapping Tables

These tables describe the basic data type mapping tables between heterogeneous databases and precautions that users should be aware of.

Since Migration Center 7.11, if a table's column length of a source database exceeds the maximum range of the data type mapped to the target database, the data type of the target database can be automatically converted to a data type with a larger range than the default mapping table. For instance, the following data types can be changed to CLOB if necessary in order to minimize data loss.

- CHAR
- VARCHAR or VARCHAR2, LVARCHAR, TT_VARCHAR

Oracle to Altibase

	Source	Destination	Notice
1	CHAR	CHAR	CHAR type columns defined with character length in Oracle are automatically converted to CHAR type columns with byte length in Altibase, because in Altibase, CHAR type columns can be defined only with byte length.
2	NCHAR	NCHAR	The explicit sizes of the source and destination NCHAR columns are the same, e.g. NCHAR(10) → NCHAR(10). However, in the Oracle JDBC driver, the size of a national character column is defined as the number of bytes used, whereas in the Altibase JDBC driver, the size of a national character column is defined as the number of characters that are stored. Please note that this means that the resultant column in Altibase will be two or three times as large as necessary.
3	VARCHAR2	VARCHAR	VARCHAR2 defined as character length in Oracle is converted into bytes in Altibase. Altibase's VARCHAR can be defined only in bytes.
4	NVARCHAR2	NVARCHAR	The column sizes differ, for the same reason as NCHAR.
5	LONG	CLOB	
6	NUMBER	NUMBER	NUMBER type columns defined without precision and scale in Oracle are converted to the same NUMBER type columns without precision and scale for Altibase. *Both Oracle and Altibase internally handle NUMBER type columns defined without precision and scale as FLOAT type in the database.
7	FLOAT	FLOAT	
8	BINARY FLOAT	FLOAT	
9	BINARY DOUBLE	DOUBLE	Special values such as NaN (Not a Number) and INF (Infinity) are not supported by Altibase. So, these values are not migrated.
10	DATE	DATE	

	Source	Destination	Notice
11	TIMESTAMP	DATE	A small amount of data loss may occur due to the difference in scale. In Oracle, the scale of a timestamp value is nanoseconds (9 digits), whereas in Altibase, the scale of a timestamp value is microseconds (6 digits)
12	RAW	BLOB	
13	LONG RAW	BLOB	
14	BLOB	BLOB	
15	CLOB	CLOB	
16	NCLOB	NVARCHAR(10666)	There is no compatible data type in Altibase for the Oracle NCLOB, so the data is stored in NVARCHAR with the maximum precision. This may cause data loss during data migration when the actual data precision exceeds the NVARCHAR maximum size.
17	ROWID	VARCHAR(18)	Oracle's ROWID converts to a character data type. Altibase does not support the data type ROWID.

MS-SQL Server to Altibase

	Source	Destination	Notice
1	BIGINT	BIGINT	
2	DECIMAL	NUMERIC	
3	INT	INTEGER	
4	NUMERIC	NUMERIC	
5	SMALLINT	SMALLINT	
6	MONEY	FLOAT	
7	TINYINT	SMALLINT	
8	SMALLINTMONEY	FLOAT	
9	BIT	CHAR(1)	
10	FLOAT	VARCHAR(310)	There is no compatible data type in Altibase for Microsoft SQL FLOAT type, so VARCHAR(310) is mapped to prevent data loss.
11	REAL	FLOAT	

	Source	Destination	Notice
12	DATE	DATE	
13	DATETIME2	DATE	A fraction of time can be loss due to difference in scale. Scale of DATETIME2 type of Microsoft SQL Server is hundreds of nanoseconds(7 digits), whereas the scale of DATE type of Altibase is only microseconds(6 digits).
14	DATETIME	DATE	
15	SMALLDATETIME	DATE	
16	CHAR	CHAR	
17	TEXT	CLOB	
18	VARCHAR	VARCHAR	
19	VARCHAR (MAX)	CLOB	
20	NVARCHAR	NVARCHAR	
21	NVARCHAR (MAX)	NVARCHAR (10666)	There is no compatible data type in Altibase for SQL Server NTEXT type, NVARCHAR is used with maximum precision. It may cause data loss during data migration when actual data precision exceeds maximum NVARCHAR size.
22	BINARY	BYTE	
23	IMAGE	BLOB	
24	VARBINARY	BLOB	
25	ALLIDENTITY	NUMERIC(38, 0)	
26	UNIQUEIDENTIFIER	VARCHAR(40)	There is no compatible data type in Altibase for SQL Server UNIQUEIDENTIFIER type, so VARCHAR type is used to prevent any data loss.
27	SYSNAME	NVARCHAR (128)	

MySQL to Altibase

	Source	Destination	Notice
1	TINYINT	SMALLINT	

	Source	Destination	Notice
2	TINYINT UNSIGNED	SMALLINT	
3	SMALLINT	INTEGER	
4	SMALLINT UNSIGNED	INTEGER	
5	MEDIUMINT	INTEGER	
6	MEDIUMINT UNSIGNED	INTEGER	
7	INT (INTEGER)	INTEGER	Please note that the minimum value of Altibase INT type (-2,147,483,647) is greater than the minimum value of MySQL INT type (- 2,147,483,648).
8	INT UNSIGNED	BIGINT	
9	BIGINT	BIGINT	Please note that the minimum value of Altibase BIGINTINT type (-9,223,372,036,854,775,807) is greater than the minimum value of MySQL BIGINT type (-9,223,372,036,854,775,808).
10	BIGINT UNSIGNED	NUMERIC(20,0)	There is no compatible data type in Altibase for MySQL BIGINT UNSIGNED type, so NUMERIC type is used to prevent any data loss.
11	DECIMAL (NUMERIC)	VARCHAR(70)	There is no compatible data type in Altibase for MySQL DECIMAL type, so VARCHAR type is used to prevent any data loss.
12	FLOAT	FLOAT	
13	DOUBLE	DOUBLE	
14	BIT	VARBIT	
15	DATETIME	DATE	Time parts are set to '0'
16	DATE	DATE	
17	TIMESTAMP	DATE	Except TIMEZONE

	Source	Destination	Notice
18	CHAR	CHAR or NCHAR	<p>The data type of Altibase varies depending on the character set of MySQL and Altibase.</p> <ul style="list-style-type: none"> - When MySQL's character set is Unicode - If Altibase's character set is Unicode, it is converted to CHAR - If Altibase's character set is not Unicode, it is converted to NCHAR
19	VARCHAR	VARCHAR or NVARCHAR or CLOB	<p>The data type of Altibase varies depending on the character set of MySQL and Altibase.</p> <ul style="list-style-type: none"> - If MySQL's character set of VARCHAR column is Unicode - If Altibase's character set is Unicode, it is converted to VARCHAR - If Altibase's character set is not Unicode, it is converted to NVARCHAR <p>If the MySQL's VARCHAR length exceeds 32,000 bytes, the maximum size of Altibase's VARCHAR, it is converted to Altibase's CLOB data type. This is to prevent data loss that may occur during migration due to the maximum size difference between MySQL and Altibase data types. MySQL's maximum value for VARCHAR is 65,536 bytes, larger than Altibase.</p>
22	BINARY	BYTE	
23	VARBINARY	BLOB	
24	TINYBLOB	BLOB	
25	MEDIUMBLOB	BLOB	
26	BLOB	BLOB	
27	LONGBLOB	BLOB	
28	TINYTEXT	VARCHAR(255)	
29	TEXT	CLOB	
30	MEDIUMTEXT	CLOB	
31	LONGTEXT	CLOB	
32	ENUM	VARCHAR(10666)	<p>There is no compatible data type in Altibase for MySQL ENUM type, so VARCHAR is used to prevent data loss.</p>

	Source	Destination	Notice
33	SET	VARCHAR(10666)	There is no compatible data type in Altibase for MySQL SET type, so VARCHAR is used to prevent data loss.

Informix 11.5 to Altibase

	Source	Destination	Notice
1	BIGINT	BIGINT	
2	INT8	BIGINT	
3	INT	INTEGER	
4	SMALLINT	SMALLINT	
5	BIGSERIAL	BIGINT	
6	SERIAL8	BIGINT	
7	SERIAL	INTEGER	
8	FLOAT	DOUBLE	
9	REAL	REAL	
10	SMALLFLOAT	REAL	
11	MONEY	NUMERIC	
12	DECIMAL_FLOAT	FLOAT	
13	DATE	DATE	
14	DATETIME	DATE	
15	BOOLEAN	CHAR(1)	
16	CHAR	CHAR	If Informix's CHAR length exceeds 32,000 bytes, the maximum size of Altibase's CHAR, it is converted to Altibase's data type to CLOB. This is to prevent data loss that may occur during migration due to the maximum size difference between Informix and Altibase data types. Informix's maximum value for CHAR is 32,767 bytes, larger than Altibase.
17	NCHAR	NCHAR	The user should note that data loss can occur due to the maximum precision of NCHAR data type at Informix(32,767) being greater than that of Altibase(32,000).
18	VARCHAR	VARCHAR	
19	NVARCHAR	NVARCHAR	

	Source	Destination	Notice
20	LVARCHAR	VARCHAR	If Informix's LVARCHAR length exceeds 32,000 bytes, the maximum size of Altibase's VARCHAR, it is converted to Altibase's data type to CLOB. This is to prevent data loss that may occur during migration due to the maximum size difference between Informix and Altibase data types. Informix's maximum value for LVARCHAR is 32,767 bytes, larger than Altibase.
21	TEXT	CLOB	
22	CLOB	CLOB	
23	BYTE	BLOB	
24	BLOB	BLOB	
25	INTERVAL	FLOAT	

TimesTen to Altibase

	Source	Destination	Notice
1	BINARY	BYTE	
2	BINARY_DOUBLE	DOUBLE	Special values such as NaN (Not a Number) and INF (Infinity) are not supported by Altibase. So, these values are not migrated.
3	BINARY_FLOAT	FLOAT	
4	BLOB	BLOB	
5	CHAR	CHAR	CHAR type columns defined with character length in TimesTen are automatically converted to CHAR type columns with byte length in Altibase, because in Altibase, CHAR type columns can be defined only with byte length.
6	CLOB	CLOB	
7	DATE	DATE	
8	NCHAR	NCHAR	
9	NCLOB	NVARCHAR(10666)	
10	NUMBER	NUMBER	

	Source	Destination	Notice
11	NVARCHAR2	NVARCHAR	The maximum size of VARCHAR2 of TimesTen is 2,097,152 bytes, which is greater than the maximum VARCHAR size of Altibase, which is 32,000; thus, the potential data loss can be occurred.
12	ROWID	VARCHAR(18)	
13	TIME	DATE	
14	TIMESTAMP	DATE	The maximum TIMESTAMP scale of TimesTen takes nanoseconds(9 digits), which is greater than the maximum DATE scale microseconds(6 digits) of Altibase; thus, the potential data loss can be occurred.
15	TT_BIGINT	BIGINT	The minimum size of TT_BIGINT in TimesTen is -9,223,372,036,854,775,808 which is smaller than the minimum BIGINT size of Altibase, which is 9,223,372,036,854,775,807; thus, the potential data loss can be occurred.
16	TT_CHAR	CHAR	
17	TT_DATE	DATE	
18	TT_DECIMAL	NUMBER	The maximum TT_DECIMAL of TimesTen is precision(40) greater than the maximum precision size(38) of NUMBER in Altibase; thus, the potential data loss can be occurred.
19	TT_INTEGER	INTEGER	The minimum TT_INTEGER size of TimesTen is -2,147,483,648, which is smaller than the minimum INTEGER size of Altibase, which is -2,147,483,647; thus, the potential data loss can be occurred.
20	TT_NCHAR	NCHAR	
21	TT_NVARCHAR	NVARCHAR	The maximum TT_NVARCHAR size (2,097,152 bytes) of TimesTen is greater than that of the Altibase(32,000 bytes); thus, the potential data loss can be occurred.

	Source	Destination	Notice
22	TT_SMALLINT	SMALLINT	The potential data loss can be occurred since the minimum TT_SMALLINT size (-32,768) of TimesTen is smaller than the minimum SMALLINT size(-32,767) of Altibase.
23	TT_TIMESTAMP	DATE	The maximum scale of TT_TIMESTAMP in TimesTen is nanoseconds (7 digits), which is greater than the maximum scale of DATE in Altibase that is microseconds (6 digits); thus, the potential data loss can be occurred.
24	TT_TINYINT	SMALLINT	
25	TT_VARCHAR	VARCHAR or CLOB	If TimesTen's TT_VARCHAR legnth exceeds 32,000 bytes, the maximum size of Altibase's VARCHAR, it is converted to Altibase's data type to CLOB. This is to prevent data loss that may occur during migration due to the maximum size difference between TimesTen and Altibase data types. TimesTen's maximum value for TT_VARCHAR is 4,194,304bytes, larger than Altibase.
26	VARBINARY	BLOB	
27	VARCHAR2	VARCHAR or CLOB	<p>1. If TimesTen's VARCHAR2 legnth exceeds 32,000 bytes, the maximum size of Altibase's VARCHAR, it is converted to Altibase's data type to CLOB. This is to prevent data loss that may occur during migration due to the maximum size difference between TimesTen and Altibase data types. TimesTen's maximum value for VARCHAR2 is 4,194,304bytes, larger than Altibase.</p> <p>2. VARCHAR2 defined as character length in TimesTen is converted into bytes in Altibase. Altibase's VARCHAR can be defined only in bytes.</p>

CUBRID to Altibase

	Source	Destination	Notice
1	SHORT	SMALLINT	The minimum SHORT value of CUBRID is - 32,768, which is smaller than the minimum value(-32,767) of SMALLINT in Altibase; thus the potential data loss can be occurred.
2	INTEGER	INTEGER	The minimum value of CUBRID(- 2,147,483,648) is smaller than that of the Altibase(-2,147,483,647); thus the potential data loss can be occurred.
3	BIGINT	BIGINT	The minimum value of CUBRID(- 9,223,372,036,854,775,808) is smaller than that of the Altibase (-9,223,372,036,854,775,807);thus the potential data loss can be occurred.
4	NUMERIC	NUMERIC	
5	FLOAT	REAL	
6	DOUBLE	DOUBLE	
7	MONETARY	DOUBLE	
8	DATE	DATE	
9	TIME	DATE	
10	TIMESTAMP	DATE	
11	DATETIME	DATE	
12	CHAR	CHAR or CLOB	If CUBRID's CHAR legnth exceeds 32,000 bytes, the maximum size of Altibase's CHAR, it is converted to Altibase's data type to CLOB. This is to prevent data loss that may occur during migration due to the maximum size difference between CUBRID and Altibase data types. CUBRID's maximum value for CHAR is 1,073,741,823 bytes, larger than Altibase.
13	VARCHAR	VARCHAR or CLOB	If CUBRID's VARCHAR legnth exceeds 32,000 bytes, the maximum size of Altibase's VARCHAR, it is converted to Altibase's data type to CLOB. This is to prevent data loss that may occur during migration due to the maximum size difference between CUBRID and Altibase data types. CUBRID's maximum value for VARCHAR is 1,073,741,823 bytes, larger than Altibase.

	Source	Destination	Notice
14	NCHAR	NCHAR	Since the maximum size of NCHAR type in CUBRID is 1,073,741,823 bytes, which is greater than that of the Altibase(16,000bytes), potential data loss can be occurred.
15	VARCHAR	NVARCHAR	The maximum size of VARCHAR type in CUBRID is 1,073,741,823 bytes and it is greater than the maximum NVARCHAR type of Altibase,which is 16,000 bytes; thus, potential data loss can be occurred.
16	STRING	VARCHAR	The potential data loss can be occurred since the maximum VARCHAR size of CUBRID is greater than that of Altibase, which is 32,000 bytes with the identical data type.
17	BIT	BLOB	
18	VARBIT	BLOB	
19	BLOB	BLOB	
20	CLOB	CLOB	
21	ENUM	VARCHAR(3200)	This is the data which is not supported by Altibase. The constants of enumeration character sting in CUBRID implement migration through arbitrarily converting them into VARCHAR type of Altibase.
22	COLLECTION	VARCHAR(3200)	This is the data type that Altibase does not support. The COLLECTION data type of CUBRID is converted as the VARCHAR data type of Altibase and the value of the former is also converted as string for the later during migrating.

Tibero to Altibase

	Source	Destination	Notice
1	CHAR	CHAR	Since Altibase's CHAR type can be defined only in byte length, in case of a column defined as character length in Tibero, it is automatically converted to byte length.
2	NCHAR	NCHAR	
3	VARCHAR	VARCHAR	Altibase's VARCHAR type can be defined only in byte length, so in case of a column defined as character length in Tibero, it is automatically converted to byte length.

	Source	Destination	Notice
4	NVARCHAR	NVARCHAR	
5	LONG	CLOB	
6	NUMBER	NUMERIC	NUMBER type columns defined without precision and scale in Tiberio are converted to the same NUMBER type columns without precision and scale for Altibase. *Both Tiberio and Altibase internally handle NUMBER type columns defined without precision and scale as FLOAT type in the database.
7	BINARY FLOAT	FLOAT	
8	BINARY DOUBLE	DOUBLE	Special values such as NaN (Not a Number) and INF (Infinity) are not supported by Altibase. So, these values are not migrated.
9	DATE	DATE	
10	TIME	DATE	
11	TIMESTAMP	DATE	A small amount of data loss may occur due to the difference in scale. In Tiberio, the scale of a timestamp value is nanoseconds(9 digits), whereas in Altibase, the scale of a timestamp value is microseconds(6 digits).
12	RAW	BLOB	
13	LONG RAW	BLOB	
14	BLOB	BLOB	
15	CLOB	CLOB	
16	NCLOB	NVARCHAR(10666)	There is no compatible data type in Altibase for the Tiberio NCLOB, so the data is stored in NVARCHAR with the maximum precision. This may cause data loss during data migration when the actual data precision exceeds the NVARCHAR maximum size.
17	ROWID	VARCHAR(18)	Tiberio's ROWID converts to a character data type. Altibase does not support the data type ROWID.

PostgreSQL to Altibase

	Source	Destination	Notice
1	SMALLINT	SMALLINT	Due to differences in range between PostgreSQL and Altibase, data loss may occur during migration. PostgreSQL's SMALLINT range is -32,768 to 32,767, whereas Altibase's range is -32,767 to 32,767.
2	INTEGER	INTEGER	Due to differences in range between PostgreSQL and Altibase, data loss may occur during migration. PostgreSQL's INTEGER range is -2,147,483,648 to 2,147,483,647, while Altibase's range is -2,147,483,647 to 2,147,483,647.
3	BIGINT	BIGINT	Due to differences in range between PostgreSQL and Altibase, data loss may occur during migration. PostgreSQL's BIGINT range is -9,223,372,036,854,775,808 to 9,223,372,036,854,775,807, whereas Altibase's range is -9,223,372,036,854,775,807 to 9,223,372,036,854,775,807.
4	NUMERIC (DECIMAL)	NUMERIC	Differences in precision and scale between PostgreSQL and Altibase may cause data loss. PostgreSQL supports precision from 1 to 1,000 and scale from 0 to <i>precision</i> , while Altibase supports precision from 1 to 38 and scale from -84 to 128. Additionally, Altibase does not support Infinity, -Infinity, or NaN, which may lead to data loss if these values are present.
5	REAL	REAL	
6	DOUBLE PRECISION	DOUBLE	
7	MONEY	VARCHAR(30)	The MONEY data type in PostgreSQL is converted to VARCHAR(30) in Altibase. If the format of MONEY values uses commas (,) as thousands separators and periods (.) as decimal separators, these values can be converted to NUMERIC(20,2) during the Reconcile step.
8	CHARACTER CHAR	CHAR	

	Source	Destination	Notice
9	CHARACTER VARYING VARCHAR	VARCHAR 또는 CLOB	Depending on character set compatibility, the Migration Center automatically adjusts column lengths. If the column length is under 32,000 bytes, VARCHAR is used; if it exceeds 32,000 bytes, CLOB is used. Note that 32,000 bytes is the maximum length for VARCHAR in Altibase.
10	TEXT	CLOB	PostgreSQL's TEXT is converted to CLOB in Altibase.
11	BOOLEAN	CHAR(1)	PostgreSQL's BOOLEAN is converted to CHAR(1) in Altibase, with true stored as 't', false as 'f', and unknown as null.
12	DATE	DATE	-infinity and infinity, stored in PostgreSQL's DATE, are converted to 21506-12-03 and 11567-08-17, respectively. PostgreSQL internally represents -infinity as 292269055-12-03 and infinity as 292278994-08-17.
13	TIME WITH TIME ZONE	DATE	Altibase does not support time-only data types; therefore, TIME WITH TIME ZONE is converted to DATE, with the time zone information lost.
14	TIME WITHOUT TIME ZONE	DATE	As Altibase does not support time-only data types, TIME WITHOUT TIME ZONE is converted to DATE.
15	TIMESTAMP WITH TIME ZONE	DATE	Time zone information is lost, with -infinity and infinity converted to 11567-08-17 and 21506-12-03, respectively, in Altibase.
16	TIMESTAMP WITHOUT TIME ZONE	DATE	PostgreSQL's TIMESTAMP WITHOUT TIME ZONE values of -infinity and infinity are converted to 11567-08-17 08:00:00.0 and 21506-12-03 08:00:00.0, respectively, in Altibase.
17	INTERVAL	VARCHAR(100)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.
18	CIDR	VARCHAR(43)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.
19	INET	VARCHAR(43)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.
20	MACADDR	VARCHAR(17)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.

	Source	Destination	Notice
21	BIT	BIT or CLOB	PostgreSQL BIT columns are converted to BIT if their length is within 64,000 bits. If they exceed 64,000 bits, they are converted to CLOB to avoid data loss due to the maximum length limit in Altibase (64,000 bits), compared to PostgreSQL's maximum of 83,886,080 bits.
22	BIT VARYING	VARBIT or CLOB	PostgreSQL BIT VARYING columns are converted to VARBIT if their length is within 64,000 bits; otherwise, they are converted to CLOB to prevent data loss. PostgreSQL BIT VARYING has a maximum length of 83,886,080 bits, exceeding the 64,000-bit limit in Altibase.
23	XML	CLOB	There is no compatible data type in Altibase, so CLOB type is used to prevent any data loss.
24	JSON	CLOB	There is no compatible data type in Altibase, so CLOB type is used to prevent any data loss.
25	JSONB	BLOB	There is no compatible data type in Altibase, so BLOB type is used to prevent any data loss.
26	ENUM	VARCHAR(32000)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.
27	UUID	VARCHAR(36)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.
28	ARRAY	VARCHAR(32000)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.
29	COMPOSITE	VARCHAR(32000)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.
30	RANGE	VARCHAR(32000)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.
31	POINT	VARCHAR(32000)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.
32	LINE	VARCHAR(32000)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.
33	LSEG	VARCHAR(32000)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.
34	BOX	VARCHAR(32000)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.
35	PATH	VARCHAR(32000)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.

	Source	Destination	Notice
36	POLYGON	VARCHAR(32000)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.
37	CIRCLE	VARCHAR(32000)	There is no compatible data type in Altibase, so VARCHAR type is used to prevent any data loss.

Automatic Correction of Character Column Length Considering Heterogeneous Character Set

When the character sets of the source and destination databases are different during migration, character data types (CHAR, VARCHAR) require length conversion.

For example, if the source database is set to the MS949 character set that requires a maximum of 2 bytes per character storage, and the target database is set to the UTF8 character set that requires 3 bytes per character, the character data of the target database is required to migrate without truncation. The size of the type should be 1.5 times the original.

Migration Center automatically performs this length conversion, and the length correction formula for character data types is as follows.

```
Dest. Size = Ceil(Correction Factor * Src. Size)
Correction Factor = Dest. MaxBytes / Src. MaxBytes
* MaxBytes = The maximum number of bytes required to store one character
```

However, if MaxBytes of the original is 1 or the correction factor is less than 1, the length conversion is not performed.

The MaxBytes and correction factors of the source and target databases can be found on the summary page of the build report.

Precautions

For large tables, the length of data storage in the target database can be much larger than the original due to length correction. If there is a guarantee that the data will not be truncated without converting the length, the length can be manually specified in the reconcile step.

Support Character Set for Each Database

For character sets not listed in the table below, Migration Center does not perform length correction.

Appendix D: Mapping Default Values

The default values for Altibase table columns are mostly compatible with the default values for the source database.

However, the default value policy can differ among heterogeneous databases. In the event of such exceptional situations, Migration Center converts source database values according to the Altibase policy.

This appendix provides a mapping table for default values according to which Migration Center converts source database default values to comply with Altibase.

Mapping Table for Default Values

Prior to migrating data, Migration Center creates a table identical to the source database table in the migration destination database. Migration Center first creates a CREATE TABLE statement with the equivalent attributes as the source database table. To set the same default values for both source table columns and target table columns, Migration Center converts the default values in the following mapping tables and specifies them in the CREATE TABLE statement, when creating the statement. Default values excluded from the table are specified in the statement without being changed.

⚠ Caution

Some default values that are not changed can be incompatible with source and destination databases. If necessary, you must manually alter the default value for the CREATE TABLE statement in the DDL Editing window at the Reconcile Step.

Default Value Mapping Policy

Default values of most of the original database are compatible with the target database without any modifications. However, Migration Center converts source database default values according to the policy of the target database system for the following exceptions.

- The CHARACTER data type with an empty string as the default value
Altibase treats empty strings ('') as NULL, meaning that no default value is assigned. For columns where the default value is an empty string and a NOT NULL constraint is present, refer to the [Empty String Handling Options](#) section.
- The DATE data type with a string expression as the default value
Since the default format for the DATE data type differs among source databases, Migration Center specifies a comment which includes the DEFAULT keyword in the CREATE TABLE statement, instead of the default value. If necessary, the user must manually set the default value later on, by referring to the comment. However, if the source database is the one among the MySQL, TimesTen or CUBRID, Migration Center automatically converts default values as shown below.
- The default value specified with a function
A function which is listed in the following table is converted accordingly, only if the function is exclusively specified as the default value in the source database. Other functions or expressions of a complex form are converted without being changed. If necessary, the user must manually change them later on.

Oracle to Altibase

Expression Type	Source(Oracle)	Destination(Altibase)	Remarks
String for CHARACTER Data Type	"		
String for DATE Data Type	'97/04/21'	/* DEFAULT '97/04/21' */	
Function	DBTIMEZONE	DB_TIMEZONE()	Supported for Altibase 6.3.1.0.0 or above.
	SYS_GUID()	SYS_GUID_STR()	Supported for Altibase 6.3.1.0.0 or above.
	UID	USER_ID()	
	USER	USER_NAME()	

The following is an example of the conversion.

Oracle CREATE TABLE Statement	Altibase CREATE TABLE Statement
<pre>CREATE TABLE testtbl_4_defval (c1 INT DEFAULT 123, c2 VARCHAR(50) DEFAULT 'test', c3 INT DEFAULT NULL, c4 CHAR(10) DEFAULT "", c5 INT DEFAULT SQRT(144) + 72, c6 DATE DEFAULT '97/04/21', c7 DATE DEFAULT TO_DATE('1999-12-01', 'YYYY-MM-DD'), c8 VARCHAR(100) DEFAULT DBTIMEZONE, c9 VARCHAR(100) DEFAULT SYS_GUID(), c10 VARCHAR(100) DEFAULT UID, c11 VARCHAR(100) DEFAULT USER);</pre>	<pre>CREATE TABLE TESTTBL_4_DEFVAL (C1 NUMBER (38, 0) DEFAULT 123, C2 VARCHAR (50) DEFAULT 'test', C3 NUMBER (38, 0), C4 CHAR (10), C5 NUMBER (38, 0) DEFAULT SQRT(144) + 72, C6 DATE /* DEFAULT '97/04/21' */, C7 DATE DEFAULT TO_DATE('1999-12-01', 'YYYY-MM-DD'), C8 VARCHAR (100) DEFAULT DB_TIMEZONE(), C9 VARCHAR (100) DEFAULT SYS_GUID_STR(), C10 VARCHAR (100) DEFAULT USER_ID(), C11 VARCHAR (100) DEFAULT USER_NAME());</pre>

MS-SQL Server to Altibase

Expression Type	Source (MS SQL Server)	Destination (Altibase)	Remarks
String for CHARACTER Data Type	"		
String for DATE Data Type	'December 5, 1985'	/* DEFAULT 'December 5, 1985' */	

Function	GETDATE90	SYSDATE	
	CURRENT_TIMESTAMP		
	LEN(str_expression)	LENGTH(str_expression)	

The following is an example of the conversion.

MS-SQL CREATE TABLE Statement	Altibase CREATE TABLE Statement
<pre>CREATE TABLE testtbl_4_defval (c1 BIT DEFAULT 0, c2 INT DEFAULT 2 + 3, c3 VARCHAR(50) DEFAULT 'test', c4 INT DEFAULT NULL, c5 NCHAR(10) DEFAULT "", c6 FLOAT DEFAULT sqrt(12 * 12), c7 DATE DEFAULT 'December 5, 1985', c8 DATE DEFAULT getdate(), c9 DATETIME DEFAULT CURRENT_TIMESTAMP, c10 INT DEFAULT len('test'),);</pre>	<pre>CREATE TABLE TESTTBL_4_DEFVAL (C1 CHAR (1) DEFAULT (0), C2 INTEGER DEFAULT (2)+(3), C3 VARCHAR (50) DEFAULT 'test', C4 INTEGER, C5 NCHAR (10), C6 VARCHAR (310) DEFAULT sqrt((12)*(12)), C7 DATE /* DEFAULT 'December 5, 1985' */, C8 DATE DEFAULT SYSDATE, C9 DATE DEFAULT SYSDATE, C10 INTEGER DEFAULT LENGTH('test'));</pre>

MySQL to Altibase

Expression Type	Source (MySQL)	Destination (Altibase)	Remarks
String for CHARACTER Data Type	"		
String for DATE Data Type	'1989-04-28'	TO_DATE('1989-04-28', 'YYYY-MM-DD')	
	'1989-04-28 12:31:29'	TO_DATE('1989-04-28 12:31:29', 'YYYY-MM-DD HH:MI:SS')	
	'0000-00-00 00:00:00'	/* DEFAULT '0000-00-00 00:00:00' */	If the default value for the DATE data type is omitted, MySQL automatically specifies it as '0000-00-00 00:00:00'. However, since this value cannot be input to the DATE type for Altibase, a comment is left.

Function	CURRENT_TIMESTAMP	SYSDATE	
	CURRENT_TIMESTAMP()		
	NOW()		
	LOCALTIME		
	LOCALTIME()		
	LOCALTIMESTAMP		
	LOCALTIMESTAMP()		

Note

If the first column of a table is of the TIMESTAMP data type, MySQL automatically specifies CURRENT_TIMESTAMP as the default value, even if the user omits it. In this case, the default value is converted to SYSDATE. Please refer to the following example.

The following is an example of the conversion.

MySQL CREATE TABLE Statement	Altibase CREATE TABLE Statement
<pre>CREATE TABLE testtbl_4_defval (c1 TIMESTAMP NOT NULL, c2 INT DEFAULT 123, c3 VARCHAR(50) DEFAULT 'test', c4 INT DEFAULT NULL, c5 CHAR(10) DEFAULT "", c6 DATE DEFAULT '1989-04-28', c7 DATETIME DEFAULT '1989-04-28 12:31:29', c8 TIMESTAMP DEFAULT '1989-04-28 12:31:29' NOT NULL, c9 TIMESTAMP NOT NULL);</pre>	<pre>CREATE TABLE TESTTBL_4_DEFVAL (C1 DATE DEFAULT SYSDATE NOT NULL, C2 INTEGER DEFAULT 123, C3 CLOB DEFAULT 'test', C4 INTEGER, C5 CHAR (10), C6 DATE DEFAULT TO_DATE('1989-04-28', 'YYYY-MM-DD'), C7 DATE DEFAULT TO_DATE('1989-04-28 12:31:29', 'YYYY-MM-DD HH:MI:SS'), C8 DATE DEFAULT TO_DATE('1989-04-28 12:31:29', 'YYYY-MM-DD HH:MI:SS') NOT NULL, C9 DATE /* DEFAULT '0000-00-00 00:00:00' */ NOT NULL);</pre>

Informix 11.5 to Altibase

Expression Type	Source (Informix)	Destination (Altibase)	Remarks
String for CHARACTER Data Type	"		
String for DATE Data Type	'2007-03-06'	/* DEFAULT '2007-03-06' */	
Function	CURRENT	SYSDATE	
	TODAY	SYSDATE	

The following is an example of the conversion.

Informix CREATE TABLE Statement	Altibase CREATE TABLE Statement
<pre>CREATE TABLE testtbl_4_defval (c1 INTEGER DEFAULT 123, c2 BOOLEAN DEFAULT 't', c3 CHAR(100) DEFAULT 'test', c4 INTEGER DEFAULT null, c5 CHAR(10) DEFAULT '', c6 DATETIME YEAR TO DAY DEFAULT DATETIME(07-3-6) YEAR TO DAY, c7 DATETIME DAY TO HOUR DEFAULT CURRENT DAY TO HOUR, c8 DATE DEFAULT TODAY);</pre>	<pre>CREATE TABLE TESTTBL_4_DEFVAL (C1 INTEGER DEFAULT 123, C2 CHAR (1) DEFAULT 't', C3 CHAR (100) DEFAULT 'test', C4 INTEGER, C5 CHAR (10), C6 DATE /* DEFAULT '2007-03- 06' */, C7 DATE DEFAULT SYSDATE, C8 DATE DEFAULT SYSDATE);</pre>

TimesTen to Altibase

Expression Type	Source(TimesTen)	Destination(Altibase)	Remarks
String for DATE Data Type	'1989-04-28'	TO_DATE('1989-04-28', 'YYYY-MM-DD')	
	'1989-04-28 12:31:29'	TO_DATE('1989-04-28 12:31:29', 'YYYY-MM-DD HH:MI:SS')	
	'12:31:29'	TO_DATE('12:31:29', 'HH:MI:SS')	
Function	UID	USER_ID	
	USER	USER_NAME	

The following is an example of the conversion.

TimesTen CREATE TABLE Statement	Altibase CREATE TABLE Statement
<pre>CREATE TABLE testtbl_4_defval (c1 INT DEFAULT 123, c2 VARCHAR2(50) DEFAULT 'test', c3 INT DEFAULT NULL, c4 DATE DEFAULT '1999-12-01', c5 TIMESTAMP DEFAULT '1999-12-01 11:30:21', c6 TIME DEFAULT '11:30:21', c7 VARCHAR(100) DEFAULT UID, c8 VARCHAR(100) DEFAULT USER);</pre>	<pre>CREATE TABLE TESTTBL_4_DEFVAL (c1 INT DEFAULT 123, c2 VARCHAR2(50) DEFAULT 'test', c3 INT DEFAULT NULL, c4 DATE DEFAULT TO_DATE('1999-12-01', 'YYYY-MM-DD'), c5 TIMESTAMP DEFAULT TO_DATE('1999-12-01 11:30:21', 'YYYY-MM-DD HH:MI:SS'), c6 TIME DEFAULT TO_DATE('11:30:21', 'HH:MI:SS'), c7 VARCHAR(100) DEFAULT UID, c8 VARCHAR(100) DEFAULT USER);</pre>

CUBRID to Altibase

Expression Type	Source(CUBRID)	Destination(Altibase)	Remarks
Function	USER	USER_ID()	
	CURRENT_USER	USER_NAME()	

The following is an example of the conversion.

CUBRID CREATE TABLE Statement	Altibase CREATE TABLE Statement
<pre>CREATE TABLE testtbl_4_defval (c1 INTEGER DEFAULT 123, c2 CHARACTER VARYING (50) DEFAULT 'test', c3 INTEGER, c4 CHARACTER VARYING (100) DEFAULT 'USER', c5 CHARACTER VARYING (100) DEFAULT 'CURRENT_USER', c6 CHARACTER VARYING(100) DEFAULT ' ', c7 DATE DEFAULT DATE'2008-10-31', c8 TIME DEFAULT TIME'1:15', c9 TIMESTAMP DEFAULT TIMESTAMP'10/31', c10 DATETIME DEFAULT DATETIME'01:15:45 PM 2008-10-31');</pre>	<pre>CREATE TABLE TESTTBL_4_DEFVAL (C1 INTEGER DEFAULT 123, C2 VARCHAR (50) DEFAULT 'test', C3 INTEGER, C4 VARCHAR (100) DEFAULT USER_ID(), C5 VARCHAR (100) DEFAULT USER_ID(), C6 VARCHAR (100) DEFAULT ' ', C7 DATE /* DEFAULT '10/31/2008' */, C8 DATE /* DEFAULT '01:15:00 AM' */, C9 DATE /* DEFAULT '12:00:00 AM 10/31/2016' */, C10 DATE /* DEFAULT '01:15:45.000 PM 10/31/2008' */);</pre>

Tibero to Altibase

Expression Type	Source(Tibero)	Destination(Altibase)	Remarks
String for CHARACTER Data Type	"		
String for DATE Data Type	'97/04/21'	/* DEFAULT '97/04/21' */	
Function	DBTIMEZONE	DB_TIMEZONE()	Supported in Altibase 6.3.1.0.0 or above.
	SYS_GUID_GUID()	SYS_GUID_STR()	Supported in Altibase 6.3.1.0.0 or above.
	UID	USER_ID()	
	USER	USER_NAME()	

The following is an example of the conversion.

Tibero CREATE TABLE Statement	Altibase CREATE TABLE Statement
<pre>CREATE TABLE testtbl_4_defval(c1 INT DEFAULT 123, c2 VARCHAR(50) DEFAULT 'test', c3 INT DEFAULT NULL, c4 CHAR(10) DEFAULT '', c5 INT DEFAULT QRT(144) + 72, c6 DATE DEFAULT '97/04/21', c7 DATE DEFAULT TO_DATE('1999-12-01', 'YYYY-MM-DD'), c8 VARCHAR(100) DEFAULT DBTIMEZONE, c9 VARCHAR(100) DEFAULT SYS_GUID(), c10 VARCHAR(100) DEFAULT UID, c11 VARCHAR(100) DEFAULT USER);</pre>	<pre>CREATE TABLE TESTTBL_4_DEFVAL(C1 NUMBER (38, 0) DEFAULT 123, C2 VARCHAR (50) DEFAULT 'test', C3 NUMBER (38, 0), C4 CHAR (10), C5 NUMBER (38, 0) DEFAULT SQRT(144) + 72, C6 DATE /* DEFAULT '97/04/21' */ , C7 DATE DEFAULT TO_DATE('1999-12-01', 'YYYY-MM-DD'), C8 VARCHAR (100) DEFAULT DB_TIMEZONE(), C9 VARCHAR (100) DEFAULT SYS_GUID_STR(), C10 VARCHAR (100) DEFAULT USER_ID(), C11 VARCHAR (100) DEFAULT USER_NAME());</pre>

PostgreSQL to Altibase

Expression Type	Source(PostgreSQL)	Destination(Altibase)	Remarks
-----------------	--------------------	-----------------------	---------

Function	current_role	USER_NAME()	
	current_schema	USER_NAME()	
	current_user	USER_NAME()	
	session_user	USER_NAME()	
	user	USER_NAME()	
	ceiling(expression)	CEIL(number)	
	random()	RANDOM(0)/2147483647	
	bit_length(string)	8*OCTET_LENGTH(expr)	
	reverse(str)	REVERSE_STR(expr)	
	strpos(string, substring)	INSTR (expr, substring)	
	clock_timestamp()	SYSDATE	
	current_date	SYSDATE	
	current_time	SYSDATE	
	current_timestamp	SYSDATE	
	localtime	SYSDATE	
	localtimestamp	SYSDATE	
	now()	SYSDATE	
	statement_timestamp()	SYSDATE	
	transaction_timestamp()	SYSDATE	

The following is an example of the conversion.

PostgreSQL CREATE TABLE Statement	Altibase CREATE TABLE Statement
<pre>CREATE TABLE testtbl_4_defval (c1 VARCHAR(50) DEFAULT current_role, c2 VARCHAR(50) DEFAULT current_schema, c3 VARCHAR(50) DEFAULT current_user, c4 VARCHAR(50) DEFAULT session_user, c5 VARCHAR(50) DEFAULT user, c6 INTEGER DEFAULT ceiling(-95.3), c7 DOUBLE PRECISION DEFAULT random(), c8 INTEGER DEFAULT bit_length('abc'), c9 VARCHAR(50) DEFAULT reverse('reverse'), c10 INTEGER DEFAULT strpos('high', 'ig'), c11 timestamp with time zone DEFAULT clock_timestamp(), c12 date DEFAULT current_date, c13 time with time zone DEFAULT current_time, c14 timestamp with time zone DEFAULT current_timestamp, c15 time DEFAULT localtime, c16 timestamp DEFAULT localtimestamp, c17 timestamp with time zone DEFAULT now(), c18 timestamp with time zone DEFAULT transaction_timestamp());</pre>	<pre>CREATE TABLE TESTTBL_4_DEFVAL (C1 VARCHAR (50) DEFAULT USER_NAME() ,C2 VARCHAR (50) DEFAULT USER_NAME() ,C3 VARCHAR (50) DEFAULT USER_NAME() ,C4 VARCHAR (50) DEFAULT USER_NAME() ,C5 VARCHAR (50) DEFAULT USER_NAME() ,C6 INTEGER DEFAULT CEIL('-95.3'),C7 DOUBLE DEFAULT (RANDOM(0)/2147483647),C8 INTEGER DEFAULT 8*OCTET_LENGTH('abc') ,C9 VARCHAR (50) DEFAULT REVERSE_STR('reverse'),C10 INTEGER DEFAULT INSTR('high', 'ig'),C11 DATE DEFAULT SYSDATE ,C12 DATE DEFAULT SYSDATE ,C13 DATE DEFAULT SYSDATE ,C14 DATE DEFAULT SYSDATE ,C15 DATE DEFAULT SYSDATE ,C16 DATE DEFAULT SYSDATE ,C17 DATE DEFAULT SYSDATE ,C18 DATE DEFAULT SYSDATE);</pre>

Empty String as a Default Value

Each database vendor handles empty strings as follows:

Database Vendor	CHAR	VARCHAR
Oracle	NULL	NULL
MySQL	Empty String	Empty String
SQL Server	Fixed-length string	Empty String
PostgreSQL	Fixed-length string	Empty String
CUBRID	Fixed-length string	Empty String
Informix	Fixed-length string	Empty String

Altibase, by default, processes empty strings as NULL. As a result, empty string data in the original database is processed as NULL during migration. If an empty string is set as the default value (`DEFAULT ''`), Altibase interprets this as `DEFAULT NULL` and removes the existing default value setting.

However, if there is a column where the **default value is an empty string and a NOT NULL constraint is set**, during migration to Altibase, the empty string is considered NULL, which will conflict with the NOT NULL constraint. To avoid potential data loss resulting from such conflicts, the Migration Center offers options to modify the default empty string value or adjust the NOT NULL constraint.

Note

Altibase distinguishes between strings composed of fixed-length spaces and NULL from empty strings. Therefore, only the items marked as **Empty String** in the table above are affected by the empty string handling options during migration.

Empty String Handling Options

Migration Center offers empty string handling options to prevent data loss. These options can be set via the menu **Migration > Migration Options**.

Object Options

Empty string handling options that can be set in the Object Options are below:

Object Options

Foreign Key Migration ☐ Yes ☒ No

PSM Migration ☒ Yes ☐ No

Drop Existing Objects ☒ Yes ☐ No

Keep Partitioned Table ☐ Yes ☒ No

Use Double-quoted Identifier ☐ Yes ☒ No

Remove FORCE from View DDL ☒ Yes ☐ No

Postfix for reserved word

Default " (Empty String) Not Null Column

Replace Default Empty String ☐ Yes ☒ No

Replacement Default Value

Remove Not Null ☐ Yes ☒ No

By configuring the options below, users can adjust the CREATE statement generated when migrating a table with columns where the default value is an empty string and a NOT NULL constraint is set.

Tip

The empty string handling options in Object Options do not directly process empty string data. **If users want to modify empty string data, users need to configure the empty string handling options in Data Options.**

Option	Description	Remarks
Replace Default Empty String	Specifies whether to replace the default value with a user-defined string in the <code>CREATE</code> statement generated by Altibase.	
Replacement Default Value	Specifies the default value to replace the empty string.	Enabled when Replace Default Empty String is set to 'Yes'.
Remove Not Null	Removes the NOT NULL constraint in the <code>CREATE</code> statement generated by Altibase.	

These options can be applied individually or in combination, providing flexibility in empty string handling according to user requirements. For instance, if the column definition in the source database is `C1 CHAR(10) DEFAULT ' ' NOT NULL`, the generated statement will differ based on the selected option combinations as below.

Replace Default Empty String	Replacement Default Value	Remove Not Null	Column Definition
Yes	EMPTY_STRING	Yes	<code>C1 CHAR(10) DEFAULT 'EMPTY_STRING'</code>
	EMPTY_STRING	No	<code>C1 CHAR(10) DEFAULT 'EMPTY_STRING' NOT NULL</code>
No	N/A	Yes	<code>C1 CHAR(10)</code>
	N/A	No	<code>C1 CHAR(10) NOT NULL</code>

Data Options

The empty string handling options that can be set in Data Options are below:

By configuring the options below, users can change empty strings discovered during data migration to a user-defined value.

Option	Description	Remarks
Replace Empty Strings in Not Null	Specifies whether to replace empty strings in columns with NOT NULL constraints with a user-defined string.	
Replacement String	Specifies the string to replace the empty string.	Enabled when Replace Empty Strings in Not Null is set to 'Yes'.
Apply to Nullable Columns	Specifies whether to replace empty string data in columns without NOT NULL constraints with the string specified in Replacement String.	Enabled when Replace Empty Strings in Not Null is set to 'Yes'.

Appendix E: PSM Converter Rule List

Migration Center provides DDL SQL texts for creating PSM type database objects with the PSM converter for Oracle or TimesTen 11.2 to Altibase Migration.

The PSM converter uses rules to convert DDL SQL texts, and these rules fall into the following three categories:

- **CONVERTED**: Convertible
- **REMOVED**: Inconvertible, but may be removable
- **TODO**: Neither convertible nor removable

If a TODO rule is applied to a PSM object, then it will show up in the To-do list pane. If not, then it will show up in the Done list pane.

If the version scope is given for a rule, it means that the rule applies to only the specified Altibase version. On omission, the rule applies to all Altibase versions.

When converting several SQL statements, end each SQL statement with a slash (/) to separate them.

View Conversion Rules

RULE-11001

Type

REMOVED

Description

'WITH CHECK OPTION' has been removed.

Original SQL Text

```
CREATE OR REPLACE VIEW v1
AS SELECT * FROM t1
WITH CHECK OPTION;
```

Processed SQL Text

```
CREATE OR REPLACE VIEW v1
AS SELECT * FROM t1
/* WITH CHECK OPTION */ /* [REMOVED] RULE-11001 : 'WITH CHECK OPTION' is removed
*/;
```

RULE-11002

Type

REMOVED

Description

The alias constraints have been removed.

Original SQL Text

```
CREATE OR REPLACE VIEW v1
(a1 UNIQUE)
AS SELECT c1 FROM t1;
```

Processed SQL Text

```
CREATE OR REPLACE VIEW v1
(a1 /* UNIQUE */ /* [REMOVED] RULE-11002 : Inline constraints are removed */)
AS SELECT c1 FROM t1;
```

RULE-11003**Type**

TODO

Description

View level constraints must be converted manually.

Original SQL Text

```
CREATE OR REPLACE VIEW v1
(c1, CONSTRAINT v1_uk UNIQUE(c1))
AS SELECT c1 FROM t1;
```

Processed SQL Text

```
CREATE OR REPLACE VIEW v1
(c1, CONSTRAINT v1_uk UNIQUE(c1) /* [TODO] RULE-11003 : Out of line constraint
must be converted manually */)
AS SELECT c1 FROM t1;
```

RULE-11004**Type**

REMOVED

Description

BEQUEATH clause has been removed.

Original SQL Text

```
CREATE OR REPLACE VIEW v1
BEQUEATH CURRENT_USER
AS SELECT * FROM t1;
```

Processed SQL Text

```
CREATE OR REPLACE VIEW v1
/* BEQUEATH CURRENT_USER */ /* [REMOVED] RULE-11004 : BEQUEATH clause is removed
*/
AS SELECT * FROM t1;
```

RULE-11005**Type**

TODO

Description

XMLType view clause should be converted manually.

Original SQL Text

```
CREATE OR REPLACE VIEW v1
OF XMLTYPE WITH OBJECT ID DEFAULT
AS SELECT * FROM t1;
```

Processed SQL Text

```
CREATE OR REPLACE VIEW v1
OF XMLTYPE WITH OBJECT ID DEFAULT /* [TODO] RULE-11005 : XMLType view should be
manually converted */
AS SELECT * FROM t1;
```

RULE-11006**Type**

TODO

Description

The clause of object type view should be manually converted.

Original SQL Text

```
CREATE OR REPLACE VIEW v1_1
OF type1 UNDER v1
AS SELECT * FROM t1;
```

Processed SQL Text

```
CREATE OR REPLACE VIEW v1_1
OF type1 UNDER v1 /* [TODO] RULE-11006 : An object view must be converted
manually */
AS SELECT * FROM t1;
```

RULE-11007

Type

REMOVED

Description

VISIBLE or INVISIBLE has been removed.

Original SQL Text

```
CREATE OR REPLACE VIEW v1  
(c1, c2 INVISIBLE)  
AS SELECT * FROM t1;
```

Processed SQL Text

```
CREATE OR REPLACE VIEW v1  
(c1, c2 /* INVISIBLE */ /* [REMOVED] RULE-11007 : VISIBLE or INVISIBLE is removed  
*/)  
AS SELECT * FROM t1;
```

RULE-11008

Type

REMOVED

Description

FORCE has been removed.

Original SQL Text

```
CREATE OR REPLACE FORCE VIEW v1  
(c1, c2)  
AS SELECT * FROM t1;
```

Processed SQL Text

```
CREATE OR REPLACE /* FORCE */ /* [REMOVED] RULE-11008 : FORCE has been removed */  
VIEW v1  
(c1, c2)  
AS SELECT * FROM t1;
```

Trigger Conversion Rules

RULE-12002

Version Scope: Less than the Altibase version 6.3.1.0.0

Type

TODO

Description

'INSTEAD OF' should be manually converted

Original SQL Text

```
CREATE OR REPLACE TRIGGER log_attendance
INSTEAD OF INSERT ON attendance_view FOR EACH ROW
BEGIN
IF :NEW.cnt < 2 THEN
INSERT INTO daily_log VALUES(:NEW.id, CURRENT_TIMESTAMP);
END IF;
END;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER log_attendance
INSTEAD OF /* [TODO] RULE-12002 : 'INSTEAD OF' must be converted manually */
INSERT ON attendance_view FOR EACH ROW
BEGIN
IF :NEW.cnt < 2 THEN
INSERT INTO daily_log VALUES(:NEW.id, CURRENT_TIMESTAMP);
END IF;
END;
```

RULE-12003

Type

TODO

Description

Triggers supporting multiple events must be converted manually.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
BEFORE INSERT OR DELETE ON t1
BEGIN
NULL;
END;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
BEFORE INSERT OR DELETE ON t1 /* [TODO] RULE-12003 : Triggers supporting multiple
events must be converted manually */
BEGIN
NULL;
END;
```

RULE-12004

This rule is about the DECLARE clause used within a PSM block, and is applied differently depending on the Altibase server version.

Type

TODO

Less than the Altibase version 6.3.1.0.0

Description

AS or IS should be used regardless of that DECLARE exists or not in the PSM block.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
BEFORE INSERT ON t1
BEGIN
NULL;
END;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
BEFORE INSERT ON t1
BEGIN /* [TODO] RULE-12004 : 'AS' or 'IS' should be used regardless of that
DECLARE exists or not in the PSM block. */
NULL;
END;
```

Altibase 6.3.1.0.0-6.5.1.3.7 or below

Description

The DECLARE preceding the PSM body should be replaced with AS or IS.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
BEFORE INSERT ON t1
DECLARE
v1 NUMBER := 1;
BEGIN
NULL;
END;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
BEFORE INSERT ON t1
DECLARE /* [TODO] RULE-12004 : 'AS' or 'IS' must replace 'DECLARE' that starts
the declarative part of the block */
v1 NUMBER := 1;
BEGIN
NULL;
END;
```

RULE-12005**Type**

TODO

Description

Non-DML triggers must be converted manually.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
BEFORE CREATE ON DATABASE
BEGIN
NULL;
END;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
BEFORE CREATE ON DATABASE /* [TODO] RULE-12005 : Non DML trigger must be
converted manually */
BEGIN
NULL;
END;
```

RULE-12007**Type**

TODO

Description

Nested tables must be converted manually.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
INSTEAD OF DELETE ON NESTED TABLE t1 OF v1
BEGIN
NULL;
END;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
INSTEAD OF DELETE ON NESTED TABLE t1 OF v1 /* [TODO] RULE-12007 : Nested table
must be converted manually */
BEGIN
NULL;
END;
```

RULE-12008**Type**

TODO

Description

The CALL routine clause must be converted manually.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER DELETE ON t1
CALL testproc1(a1, a2);
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER DELETE ON t1
CALL testproc1(a1, a2) /* [TODO] RULE-12008 : CALL routine clause must be
converted manually */;
```

RULE-12009**Type**

TODO

Description

The parent row of a nested table cannot be specified.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
INSTEAD OF DELETE ON NESTED TABLE t1 OF v1
REFERENCING PARENT AS parent FOR EACH ROW
BEGIN
NULL;
END;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
INSTEAD OF DELETE ON NESTED TABLE t1 OF v1
REFERENCING PARENT AS parent /* [TODO] RULE-12009 : Parent value of the current
row cannot be specified */ FOR EACH ROW
BEGIN
NULL;
END;
```

RULE-12010**Type**

TODO

Description

The trigger ordering clause should be converted manually.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER DELETE ON t1
FOLLOWS trig2
BEGIN
NULL;
END;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER DELETE ON t1
FOLLOWS trig2 /* [TODO] RULE-12010 : Trigger ordering clause must be converted
manually */
BEGIN
NULL;
END;
```

RULE-12011**Type**

CONVERTED

Description

The omitted correlation name has been added in the REFERENCING clause.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER INSERT ON t1 FOR EACH ROW
BEGIN
:new.c1 := SYSDATE;
END;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER INSERT ON t1
REFERENCING NEW AS new FOR EACH ROW
DECLARE
BEGIN
:new.c1 := SYSDATE;
END;
```

RULE-12012**Type**

CONVERTED

Description

A suffix has been added to the local identifier corresponding to the reserved words of Altibase.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER UPDATE ON t1
REFERENCING NEW AS new OLD AS old FOR EACH ROW
BEGIN
NULL;
END;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER UPDATE ON t1
REFERENCING NEW AS new_POC OLD AS old_POC FOR EACH ROW
BEGIN
NULL;
END;
```

RULE-12013**Type**

REMOVED

Description

The trigger edition clause has been removed.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER DELETE ON t1
CROSSEDITION
BEGIN
NULL;
END;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER DELETE ON t1
/* CROSSEDITION */ /* [REMOVED] RULE-12013 : Trigger edition clause is removed */
BEGIN
NULL;
END;
```

RULE-12014

Type

REMOVED

Description

The ENABLE is removed.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER INSERT ON t1
ENABLE
BEGIN
NULL;
END;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER INSERT ON t1
/* ENABLE */ /* [REMOVED] RULE-12014 : ENABLE is removed */
BEGIN
NULL;
END;
```

RULE-12015

Type

TODO

Description

The DISABLE should be converted manually.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER DELETE ON t1
DISABLE
BEGIN
NULL;
END;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER DELETE ON t1
DISABLE /* [TODO] RULE-12015 : DISABLE must be converted manually */
BEGIN
NULL;
END;
```

RULE-12016

Type

CONVERTED

Description

The colon preceding the alias referring to the rows defined in the REFERENCING clause has been eliminated.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
BEFORE INSERT ON t1 FOR EACH ROW
BEGIN
DBMS_OUTPUT.PUT_LINE(:new.c1);
END;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
BEFORE INSERT ON t1 FOR EACH ROW
BEGIN
DBMS_OUTPUT.PUT_LINE(new.c1);
END;
```

RULE-12017

Type

REMOVED

Description

The trigger label name at the end of PL/SQL block has been removed in the CREATE TRIGGER statement.

Original SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER INSERT ON t1
BEGIN
NULL;
END trig1;
```

Processed SQL Text

```
CREATE OR REPLACE TRIGGER trig1
AFTER INSERT ON t1
BEGIN
NULL;
END /* trig1 */ /* [REMOVED] RULE-12017 : The trigger label name at the end of
body has been removed */;
```

Function Conversion Rules

RULE-13001

Version Scope: Less than the Altibase version 6.3.1.0.0

Type

TODO

Description

The AS LANGUAGE clause must be converted manually.

Original SQL Text

```
CREATE OR REPLACE FUNCTION func1
RETURN VARCHAR2
AS LANGUAGE JAVA
NAME 'test.quote() return java.lang.String';
```

Processed SQL Text

```
CREATE OR REPLACE FUNCTION func1
RETURN VARCHAR2
AS LANGUAGE JAVA
NAME 'test.quote() return java.lang.String'/* [TODO] RULE-13001 : AS LANGUAGE
clause must be converted manually */;
```

RULE-13002

Type

REMOVED

Description

The AUTHID clause is removed.

Original SQL Text

```
CREATE OR REPLACE FUNCTION func1(a1 NUMBER)
RETURN NUMBER
AUTHID CURRENT_USER
IS
BEGIN
RETURN a1;
END;
```

Processed SQL Text

```
CREATE OR REPLACE FUNCTION func1(a1 NUMBER)
RETURN NUMBER
/* AUTHID CURRENT_USER */ /* [REMOVED] RULE-13002 : The invoker rights clause is
removed */
IS
BEGIN
RETURN a1;
END;
```

RULE-13003**Type**

REMOVED

Description

The PARALLEL_ENABLE clause is removed.

Original SQL Text

```
CREATE OR REPLACE FUNCTION func1(a1 NUMBER)
RETURN NUMBER
PARALLEL_ENABLE
IS
BEGIN
RETURN a1;
END;
```

Processed SQL Text

```
CREATE OR REPLACE FUNCTION func1(a1 NUMBER)
RETURN NUMBER
/* PARALLEL_ENABLE */ /* [REMOVED] RULE-13003 : PARALLEL_ENABLE clause is removed
*/
IS
BEGIN
RETURN a1;
END;
```

RULE-13004

Type

REMOVED

Description

The RESULT_CACHE clause is removed.

Original SQL Text

```
CREATE OR REPLACE FUNCTION func1(a1 NUMBER)
RETURN NUMBER
RESULT_CACHE RELIES_ON(t1, t2)
IS
BEGIN
RETURN a1;
END;
```

Processed SQL Text

```
CREATE OR REPLACE FUNCTION func1(a1 NUMBER)
RETURN NUMBER
/* RESULT_CACHE RELIES_ON(t1, t2) */ /* [REMOVED] RULE-13004 : RESULT_CACHE
clause is removed */
IS
BEGIN
RETURN a1;
END;
```

RULE-13005

Type

REMOVED

Description

DETERMINISTIC is removed

Original SQL Text

```
CREATE OR REPLACE FUNCTION func1(a1 NUMBER)
RETURN NUMBER
DETERMINISTIC
IS
BEGIN
RETURN a1;
END;
```

Processed SQL Text

```
CREATE OR REPLACE FUNCTION func1(a1 NUMBER)
RETURN NUMBER
/* DETERMINISTIC */ /* [REMOVED] RULE-13005 : 'DETERMINISTIC' is removed */
IS
BEGIN
RETURN a1;
END;
```

RULE-13006

Type

TODO

Description

The PIPELINED keyword must be converted manually.

Original SQL Text

```
CREATE FUNCTION getCityList RETURN tripLog_pkg.nt_city PIPELINED AS
BEGIN
FOR i IN 1..tripLog_pkg.v_cityList.LAST LOOP
PIPE ROW(tripLog_pkg.v_cityList(i));
END LOOP;
RETURN;
END;
```

Processed SQL Text

```
CREATE FUNCTION getCityList RETURN tripLog_pkg.nt_city PIPELINED /* [TODO] RULE-
13006 : The keyword PIPELINED must be converted manually */ AS
BEGIN
FOR i IN 1 .. tripLog_pkg.v_cityList.LAST LOOP
PIPE ROW(tripLog_pkg.v_cityList(i)) /* [TODO] RULE-32012 : The PIPE ROW statement
must be converted manually */;
END LOOP;
RETURN;
END;
```

RULE-13007

Type

TODO

Description

The PIPELINED USING/AGGREGATE USING clause must be converted manually.

Original SQL Text

```
CREATE OR REPLACE FUNCTION func1
RETURN NUMBER
AGGREGATE USING implementation_type;
```

Processed SQL Text

```
CREATE OR REPLACE FUNCTION func1
RETURN NUMBER
AGGREGATE USING implementation_type/* [TODO] RULE-13007 : PIPELINED USING or
AGGRAGATE USING clause must be converted manually */;
```

RULE-13008

Version Scope: Altibase 6.3.1.0.0 or above

Type

TODO

Description

The WITH CONTEXT clause should be manually converted.

Original SQL Text

```
CREATE OR REPLACE FUNCTION func1
RETURN NUMBER IS
LANGUAGE C LIBRARY lib1 WITH CONTEXT PARAMETERS(CONTEXT);
```

Processed SQL Text

```
CREATE OR REPLACE FUNCTION func1
RETURN NUMBER IS
LANGUAGE C LIBRARY lib1 WITH CONTEXT /* [TODO] RULE-13008 : WITH CONTEXT clause
must be converted manually */PARAMETERS(CONTEXT)
```

RULE-13009

Version Scope: Altibase 6.3.1.0.0 or above

Type

TODO

Description

The AGENT IN clause should be manually converted.

Original SQL Text

```
CREATE OR REPLACE FUNCTION func1
RETURN NUMBER IS
LANGUAGE C LIBRARY lib1 AGENT IN(EXTPROC);
```

Processed SQL Text

```
CREATE OR REPLACE FUNCTION func1
RETURN NUMBER IS
LANGUAGE C LIBRARY lib1 AGENT IN(EXTPROC)/* [TODO] RULE-13009 : AGENT IN clause
must be converted manually */;
```

RULE-13010**Type**

REMOVED

Description

The ACCESSIBLE BY clause has been removed.

Original SQL Text

```
CREATE OR REPLACE FUNCTION func1(a1 NUMBER)
RETURN NUMBER
ACCESSIBLE BY (TRIGGER trig1)
IS
BEGIN
RETURN a1;
END;
```

Processed SQL Text

```
CREATE OR REPLACE FUNCTION func1(a1 NUMBER)
RETURN NUMBER
/* ACCESSIBLE BY (TRIGGER trig1) */ /* [REMOVED] RULE-13010 : The ACCESSIBLE BY
clause is removed */
IS
BEGIN
RETURN a1;
END;
```

RULE-13011

Version Scope: Altibase 6.3.1.0.0 or later

Type

TODO

Description

JAVA call specification should be manually converted.

Original SQL Text

```
CREATE OR REPLACE FUNCTION func1(a1 VARCHAR2)
RETURN VARCHAR2 IS
LANGUAGE JAVA NAME
'com.altibase.ex.empMgr.addEmp(java.lang.String)';
```

Processed SQL Text

```
CREATE OR REPLACE FUNCTION func1(a1 VARCHAR2)

Package Conversion Rules

RULE-16001

Type

REMOVED

Description

The AUTHID clause is removed.

Original SQL Text

```
CREATE OR REPLACE PACKAGE empMgr_pkg AUTHID CURRENT_USER
AS PROCEDURE delete(p_id INTEGER);
END;
```

Processed SQL Text

```
CREATE OR REPLACE PACKAGE empMgr_pkg /* AUTHID CURRENT_USER */ /* [REMOVED] RULE-
16001 : The invoker rights clause is removed */
AS PROCEDURE delete(p_id INTEGER);
END;
```

RULE-16002

Type

REMOVED

Description

The ACCESSIBLE BY clause has been removed.

Original SQL Text

```
CREATE OR REPLACE PACKAGE pkg1
ACCESSIBLE BY (TRIGGER trig1)
AS
END;
```

Processed SQL Text

```
CREATE OR REPLACE PACKAGE pkg1
/* ACCESSIBLE BY (TRIGGER trig1) */ /* [REMOVED] RULE-16002 : The ACCESSIBLE BY
clause is removed */
AS
END;
```

Library Conversion Rules

RULE-17001

Type

REMOVED

Description

The AGENT clause is removed.

Original SQL Text

```
CREATE OR REPLACE LIBRARY lib1 AS
'${ORACLE_HOME}/lib/test_lib.so' AGENT 'test.rule.no_17001.com';
```

Processed SQL Text

```
CREATE OR REPLACE LIBRARY lib1 AS
'${ORACLE_HOME}/lib/test_lib.so' /* AGENT 'test.rule.no_17001.com' */ /*
[REMOVED] RULE-17001 : Agent clause is removed */;
```

RULE-17002

Type

REMOVED

Description

The UNTRUSTED keyword is removed.

Original SQL Text

```
CREATE OR REPLACE LIBRARY lib1 UNTRUSTED
AS '${ORACLE_HOME}/lib/test_lib.so';
```

Processed SQL Text

```
CREATE OR REPLACE LIBRARY lib1 /* UNTRUSTED */ /* [REMOVED] RULE-17002 : The
keyword UNTRUSTED is removed */
AS '${ORACLE_HOME}/lib/test_lib.so';
```

DML Conversion Rules

RULE-20001

Type

TODO

Description

The Flashback Query clause should be manually converted.

Original SQL Text

```
CREATE OR REPLACE VIEW v1 AS
SELECT * FROM t1 CROSS JOIN t2 VERSIONS BETWEEN TIMESTAMP MINVALUE AND MAXVALUE;
```

Processed SQL Text

```
CREATE OR REPLACE VIEW v1 AS
SELECT * FROM t1 CROSS JOIN t2 VERSIONS BETWEEN TIMESTAMP MINVALUE AND MAXVALUE/*

```

RULE-20059

Type

TODO

Altibase version tag 6.5.1.0.0 or earlier

Description

The TABLE function should be manually converted.

Original SQL Text

```

CREATE OR REPLACE VIEW v1 AS
SELECT *
FROM TABLE(func1('ALTIBASE'));

```

Processed SQL Text

```

CREATE OR REPLACE VIEW v1 AS
SELECT *
FROM TABLE(func1('ALTIBASE')) /* [TODO] RULE-20059 : Table function must be
converted manually */;

```

Altibase version tag 6.5.1.0.0 or later

Type

TODO

Description

DML(INSERT, DELETE, and UPDATE) used in the TABLE functions should be manually converted.

Original SQL Text

```

CREATE OR REPLACE PROCEDURE proc1 AS
BEGIN
  DELETE FROM TABLE(SELECT c2 FROM t1) t WHERE t.c1 = 1;
END;

```

Processed SQL Text

```
CREATE OR REPLACE PROCEDURE proc1 AS
BEGIN
DELETE FROM TABLE(SELECT c2 FROM t1) t /* [TODO] RULE-20059 : The TABLE function
with DML(insert, delete, update) must be converted manually */ WHERE t.c1 = 1;
END;
```

RULE-20060

Version Scope: AltiBase version tag 6.5.1.0.0 or later

Type

TODO

Description

The (+) operator should be manually converted.

Original SQL Text

```
CREATE OR REPLACE VIEW v1 AS
SELECT t1.c1, t1_c2.c2
FROM t1, TABLE(t1.c2) (+) t1_c2;
```

Processed SQL Text

```
CREATE OR REPLACE VIEW v1 AS
SELECT t1.c1, t1_c2.c2
FROM t1, TABLE(t1.c2) (+) /* [TODO] RULE-20060 : The (+) operator must be
converted manually */ t1_c2;
```

RULE-20061

Version Scope: AltiBase version tag 6.5.1.0.0 or later

Type

TODO

Description

The collection expression arguments in the TABLE function should be the user-defined function.

Original SQL Text

```
CREATE OR REPLACE VIEW v1 AS
SELECT *
FROM TABLE(SELECT c2 FROM t1);
```

Processed SQL Text

```
CREATE OR REPLACE VIEW v1 AS
SELECT *
FROM TABLE(SELECT c2 FROM t1) /* [TODO] RULE-20061 : The collection expression
arguments in the TABLE function should be the user-defined function */;

dual;
```

RULE-40022

Type

CONVERTED

Description

The third argument of the function 'SYS_CONTEXT', which indicates the length of the return value, is converted to the function 'SUBSTR' surrounding 'SYS_CONTEXT'.

Original SQL Text

```
CREATE VIEW v_r40022 AS SELECT SYS_CONTEXT('USERENV', 'INSTANCE_NAME', 100) FROM
dual;
```

Processed SQL Text

```
CREATE VIEW v_r40022 AS SELECT SUBSTR(SYS_CONTEXT('USERENV', 'INSTANCE_NAME'), 0,
100) FROM dual;
```

Appendix F: FAQ

Common

OutOfMemoryError occurs during data transfer.

Cause

This error can occur due to a lack of memory while several threads are inserting data into the target database through batch operations.

Solution

According to the error message output from OutOfMemoryError, there are two cases as below.

<Java heap space>

Depending on the situation, you can choose between the two methods below.

- Change performance property values to reduce memory usage
 1. Open the project.
 2. Click the menu "Migration" → "Migration Options".
 3. Lower the Batch Size and Thread Count values
- Increase the maximum amount of memory the program can use
 1. Open the executable file (migcenter.bat or migcenter.sh) with the editor.
 2. Set the value of the option '-Xmx' that sets the maximum heap size in the JVM to be higher than the existing value.

Note

On Windows 32 bit machines, you can set Xmx values up to 1.5 GB due to OS dependency.

<PermGen space>

1. Open the executable file (migcenter.bat or migcenter.sh) with the editor.
2. Set the '-XX: MaxPermSize' option to set the maximum size of the permanent generation space in the JVM above the existing value.

<Metaspace>

If the version of the JVM you are using is Java 8 or higher, the lack of space in Metaspace may be the cause. Metaspace, implemented since Java 8, is a replacement for PermGen (permanent generation space).

1. Open the executable file (migcenter.bat or migcenter.sh) with an editor.
2. Change '-XX: MaxPermSize', which is the option to set the maximum size of permanent generation space in JVM, to an option that determines the maximum size of the metaspace, and modify it higher than the existing value.
 - Before change: -XX:MaxPermSize=128m
 - After change: -XX:MaxMetaspaceSize=256 m

- <https://www.infoq.com/articles/Java-PERMGGEN-Removed>

The NOT NULL constraint on a table column whose data type is LOB is not migrated.

Cause

It is a phenomenon that the Migration Center arbitrarily removes the NOT NULL constraint on the LOB column.

The Migration Center inserts data into the target database using a query that contains parameters (for example, "insert into tablename values (?,?)").

Unlike other columns, Altibase processes data into LOB columns by initializing data to null first, then receiving data through LOB Locator and inputting data. Therefore, if the column has a NOT NULL constraint, the insertion is failed because the data cannot be initialized to null.

In order to overcome this difference, the Migration Center removes the NOT NULL constraint on the LOB column to perform data migration. For more detailed information, refer to the *General Reference* - 1. Data Type - LOB Data Type - Restrictions.

Because Oracle performs constraint checking only at commit time, you can insert data even under these conditions.

Solution

After the migration, execute an SQL statement that adds a NOT NULL constraint to the corresponding column in Altibase

Database Character Set Notes

Generally, it is recommended to use the same DB character set of the source database and target database.

If you need to specify different character sets because of special circumstances, you should check whether each DB character set is compatible. If you migrate data between incompatible character sets, the data may be corrupted.

Example

1. From source database KSC5601 to Destination database UTF8:

Migratable

KSC5601 Korean data can be written in UTF8. Therefore, each character set is compatible with each other.

Note: Because the data length can be longer, you need to increase the size of the character type column when you relocate the table object.

2. From source database KSC5601 to Destination database GB231280:

Not migratable

KSC5601 Korean data cannot be written as GB231280. Therefore, each character set is incompatible with each other.

If data migration is required under these conditions, the table column data types CHAR and VARCHAR of the target database should all be changed to NCHAR and NVARCHAR, and data transfer must be performed.

JDBC & Migration Center Character Set Process

1. When fetching data from the source database, get the char data as the source database DB character set and store it in a byte array.
2. Convert the data stored in the byte array to UTF-16 format and store it in a String object of Java base type.
3. Pass the String object to the PreparedStatement object that inserts the data into the target database with the setString function.
4. JDBC driver converts the String object into data into the DB character set of the target database and insert them into the target database.

The program terminates abnormally while selecting the JDBC driver file.

Cause

This is an error that can occur when running the Migration Center in a Windows environment. While selecting the JDBC driver file when registering the connection information, changing the directory may cause the problem that the program terminates abnormally. This is a Java JVM crash caused by a communication problem between the JVM and the Windows operating system. Users can check for the Java crashes that usually occurs in the old version of the JVM through the link below.

http://www.java.com/en/download/help/error_hotspot.xml

Solution

Install the latest version of the JRE, modify the JAVA_HOME path in the migcenter.bat file, and rerun the Migration Center.

When running the CLI Mode, UnsatisfiedLinkError: /usr/lib/jvm/java-8-oracle/jre/lib/amd64/libawt_xawt.so: libXrender.so.1: cannot open shared object file: No such file or directory has occurred.

This error occurs when the 64-bit libXrender.so file is requested by the JVM, but the package is not installed in the OS.

Cause

This usually occurs when you install a 32-bit JRE on a 64-bit device and try to run the Java program by using it.

Solution

After installing a new JRE that matches the bit value of the device, change JAVA_HOME to the appropriate location. Debian-like Linux installs a package by executing the following command.

```
sudo apt-get install libxrender1
```

References

- <http://www.jmeter-archive.org/Bug-in-running-Jmeter-on-Ubuntu-12-04-td5722692.html>
- <https://www.spigotmc.org/threads/bungeecord-not-starting-up-on-java-8.24652/>

When Running the Migration Center, the message "Could not create the java virtual machine" is displayed and the startup fails.

Cause

This is an error that can occur when the maximum memory allocation value (-Xmx) set in bat and sh is larger than the memory allocated by the system. In particular, this error is frequently reported in Window O/S 32 bit.

Solution

Change the value of -Xms -Xmx in bat and sh according to the user environment, and then restart Migration Center.

Oracle

The error message 'ORA-01652 unable to extend temp segment by 128 in tablespace TEMP' is printed.

Cause

This error is caused by a lack of Oracle's temporary tablespace space during large-volume query processing.

Solution

The temporary table space for the connected user must be extended.

During the Run step, error message 'Fetch data from source database has been failed. Stream has already been closed' is printed and migration of some data is failed.

Cause

Tables containing LONG or LONG RAW and LOB columns can cause problems during data migration. Below is an excerpt from the [Oracle JDBC Developer's Guide](#).

12. Java Streams in JDBC - Streaming LONG or LONG RAW Columns

Because the column data remains in the communications channel, the streaming mode interferes with all other use of the connection. Any use of the connection, other than reading the column data, will discard the column data from the channel.

In Oracle, data transmission of a LONG or LONG RAW column is done through a stream. If stream of other data types also is transmitted through the same connection, the data transmission can be interrupted. This means that if a LONG or LONG RAW column and a LOB column are in the same table, it cannot guarantee that the data in the table will succeed. For this reason, Oracle does not recommend using this configuration.

Solution

The table cannot be migrated via the Migration Center.

When you start the Reconcile step, the error message 'Unable to find any volatile tablespace to store temporary tables in the destination database' is displayed.

Cause

If there is a global temporary table among the list of migration objects of the source database, Oracle, a volatile tablespace must exist in the target database, Altibase. Oracle's global temporary tables are migrated to Altibase's temporary tables, and Altibase's temporary tables can only be stored in volatile tablespaces. (Refer to the manual: *SQL Reference* - 3. Data Definition Language - CREATE TABLE - Description)

When performing the Reconcile step, the Migration Center takes a list of Altibase tablespaces that the user can access and tries to map tablespaces and tables between databases. At this time, this error occurs when there is no accessible volatile tablespace in Altibase to be mapped for a global temporary table in Oracle.

Solution

Create a volatile tablespace in the target database, Altibase, grant access privileges, and then perform the reconcile step again.

SQLException: Protocol violation occurs during data migration.

Cause

An OOM error occurred during communication and it was lost, and a protocol violation error was returned.

Solution

Increase the maximum memory size that the program can use.

1. Open the executable file (migcenter.bat or migcenter.sh) with an editor.
2. Modify the value of option '-Xmx', which determines the maximum heap size in the JVM, than the existing value.

References:

- <https://stackoverflow.com/questions/29372626/sqlexception-protocol-violation-in-oracle>
- <https://stackoverflow.com/questions/18227868/protocol-violation-oracle-jdbc-driver-issue?rq=1>

Various SQLExceptions can occur after an OutOfMemoryError occurs during data migration.

During a large amount of data migration, there are several cases in which there are multiple SQLException related to fetch or bind in Oracle. In this case, if only one of the tables is successful in table mode, the error caused by OOM can be suspected.

```
Caused by: java.sql.SQLException: Fail to convert to internal representation
at
oracle.jdbc.driver.CharCommonAccessor.getBigDecimal(CharCommonAccessor.java:414)

Invalid column type: getCLOB not implemented for class
oracle.jdbc.driver.T4CVarCharAccessor
```

Cause

Various malfunctions are possible after the OOM occurs inside the Oracle JDBC driver.

Solution

Refer to `OutOfMemoryError` in the Common section.

NullPointerException may occur during the build step.

When the source database is Oracle 9i, 10, the following `NullPointerException` may occur during the build step due to Oracle JDBC driver compatibility error:

```
Fail to retrieve Source DDL: java.lang.NullPointerException
at oracle.jdbc.driver.T4C8Oall.getNumRows(T4C8Oall.java:1046)
at
oracle.jdbc.driver.T4CPreparedStatement.executeForRows(T4CPreparedStatement.java:
1047)

oracle.jdbc.driver.OraclePreparedStatement.executeInternal(OraclePreparedStatement
.java:3608)
at
oracle.jdbc.driver.OraclePreparedStatement.executeQuery(OraclePreparedStatement.j
ava:3652)
at
oracle.jdbc.driver.OraclePreparedStatementWrapper.executeQuery(OraclePreparedStatementWrapper
.java:1207)
at
com.altibase.migLib.meta.SrcDbMeta_Oracle_9_0_0_0.getSrcDdlDbmsMetaData(SrcDbMeta
_Oracle_9_0_0_0.java:2251)
```

Cause

Oracle JDBC Driver compatibility issues

Solution

Replace the JDBC driver file for Oracle in MigrationCenter with the JDBC driver file for your Oracle DBMS.

MS-SQL

When "Test" button is pressed during connection information registration, connection is failed with error message

Cause

During registering MS-SQL connection information, when "Test" button is clicked, the following error message may be displayed:

- Migration Center can support MS-SQL user who has a single schema only.
- User doesn't have appropriate schema in target database.

Registration is not allowed because the schema relationship of the user of the connection information is incompatible with Altibase.

MS-SQL has a different relationship between users and schemas from that of Altibase. Altibase has a structure that a single schema is assigned to each user and the database object is dependent on the schema. On the other hand, in MS-SQL, a single user is allowed to have from zero to multiple schemas, and each schema has its own database objects. the Migration Center allows connection information registration only if the MS-SQL user owns only one schema.

Therefore, if an MS-SQL user has no schema or multiple schemas, it is unable to register a connection information with that user due to schema structure difference.

Solution

Let the user of the connection information have only one schema.

When the "Test" button is pressed during connection information registration, the program stops.

Cause

It is presumably due to a conflict between the JVM installed on the appliance and the JVM embedded in the Migration Center. This problem may be shown up when the running operating system is Windows and a Java Runtime Environment (JRE) is installed before installing a Migration Center.

Solution

You should open the executable file migcenter.bat with an editor and change the value of the environment variable JAVA_HOME to the location of the JRE already installed on the machine. The JRE should be changed to Java SE 8.0 or later.

The error message 'Unable to insert (or update) NULL into NOT NULL column.' is printed and data migration is failed.

Cause

This is because the difference between databases on how to handle empty strings in column with NOT NULL constraint. MS-SQL allows inserting an empty string into a table column that is subject to a NOT NULL constraint. In Altibase, an empty string means NULL, so it does not allow inserting an empty string into a table column that is subject to a NOT NULL.

Solution

Adjust [Empty String Handling Options](#) of Data Options, and retry data migration.

Migration of duplicate foreign key is failed.**Cause**

MS-SQL allows duplicate foreign keys while Altibase does not. So, only one foreign key will be migrated.

Solution

In the "Missing" tab of the report created after the Run step, you can see the foreign keys that failed to escalate.

The error message 'The server selected protocol version TLS10 is not accepted by client preferences' is printed and connection fails.**Cause**

The issue occurs because the Java Runtime Environment (JRE) used to run the Migration Center has been updated to default to TLS 1.2 or later, while the MS-SQL server does not support the newer TLS versions.

Solution

To enable the use of older TLS versions, remove TLSv1 and TLSv1.1 from the `jdk.tls.disabledAlgorithms` in the `java.security` file.

The path to the `java.security` file depends on the Java version:

- Java 10 and earlier: `$JAVA_HOME/jre/lib/security`
- Java 11 and later: `$JAVA_HOME/conf/security`

```
//jdk.tls.disabledAlgorithms=SSLv3, TLSv1, TLSv1.1, RC4, DES, MD5withRSA,
jdk.tls.disabledAlgorithms=SSLv3, RC4, DES, MD5withRSA,
```

If using TLS 1.2 or later is mandatory, refer to [KB3135244 - TLS 1.2 support for Microsoft SQL Server](#) to update Windows, MS-SQL server, and the MS-SQL JDBC driver file.

Using a JDBC driver that is not compatible with the Java version running the Migration center may result in the following error: "Unable to connect to DB. javax.xml.bind/DatatypeConverter."

Running the Migration Center on Java 11 or later while using a JDBC driver designed for JRE 10 or earlier may result in the following error: *"Unable to connect to DB. javax.xml.bind/DatatypeConverter."*

Cause

This error occurs because the JDBC driver designed for JRE 10 or earlier references the `javax.xml.bind` module, which has been removed in Java 11 and later versions.

Solution

Use a JDBC driver file that is compatible with the Java version running the Migration Center.

Example) mssql-jdbc-7.2.2~~1~~**1**.jar

Altibase**When migrating Altibase version 5.1.5 or lower, the characters are broken.****Cause**

Altibase version 5.1.5 or lower does not support globalization, so JDBC does not know how to handle the character set of the database.

Solution

You must include the character set value (for example, KSC5601) set in the destination database in the encoding option of the corresponding database connection information in the Migration Center. Here's how to check the Altibase character set.

- Version 4.3.9-5.1.5:

```
SELECT VALUE1 FROM V$PROPERTY WHERE NAME = 'NLS_USE';
```

- Version 5.3.3 or later:

```
SELECT NLS_CHARACTERSET FROM V$NLS_PARAMETERS;
```

In the Reconcile step, "Tablespace to Tablespace Mapping" does not show a specific tablespace.**Cause**

The user in the connection information at the Migration Center does not have privilege to access to the tablespace.

Solution

Grant the Altibase user access to the tablespace.

When migrating Altibase version 4.5.1.0 or earlier, it fails to retrieve information of a column whose data type is BLOB, byte, or nibble.**Cause**

The Altibase JDBC driver of the corresponding version cannot return the BLOB, byte, or nibble data type to UNKNOWN to know the column data type.

Solution

Tables with BLOB, byte, and nibble data types are migrated using aexport and iLoader.

Some data of bit, varbit, and nibble data types migrated from Altibase 6.1.1 and earlier versions do not match the original database.

Cause

When the Altibase 6.1.1 or lower JDBC driver inserts bit, varbit, or nibble type data in batch execution, it fails to migrate some data normally.

Solution

Open the project, click the menu Migration-Migration Option, select 'No' for Batch Execution, and perform data migration.

Informix

Java.sql.SQLException: Encoding or code set not supported in Informix JDBC Driver during data migration."

The following SQLException occurred while fetching from Informix during data migration. This is an exception that occurs when retrieving this value when a byte of a multi-byte character is input to the Informix DB while being cut off.

```
java.sql.SQLException: Encoding or code set not supported.
at com.informix.util.IfxErrMsg.getSQLException(IfxErrMsg.java:412)
at com.informix.jdbc.IfXChar.fromIfx(IfXChar.java:235)
at com.informix.jdbc.IfXRowColumn.a(IfXRowColumn.java:380)
at com.informix.jdbc.IfXRowColumn.a(IfXRowColumn.java:282)
at com.informix.jdbc.IfXSqli.a(IfXSqli.java:4657)
at com.informix.jdbc.IfXResultSet.a(IfXResultSet.java:666)
at com.informix.jdbc.IfXResultSet.b(IfXResultSet.java:638)
at com.informix.jdbc.IfXResultSet.getString(IfXResultSet.java:724)
at
com.altibase.migLib.run.databinder.DataBinder.getValuesFromSrc(DataBinder.java:44
5)
```

Cause

If an Informix DB is entered with bytes of multi-byte characters truncated, an exception occurs when retrieving this value.

Solution

Add IFX_USE_STRENC = true to Informix connection properties.

References

<https://m.blog.naver.com/PostView.nhn?blogId=jangkeunna&logNo=70146227929&proxyReferer=https%3A%2F%2Fwww.google.co.kr%2F>

MySQL

When the data type of a table column is VARCHAR or CHAR with a size of 1 or 2, data of size 1 is migrated to null.

Cause

If you find that the MySQL JDBC driver returns a null value when importing data with a size of 1, it is probably a MySQL JDBC driver issue.

Solution

You need to replace the driver with version 5.0.8 of MySQL Connector/J([link](#)). If the same happens in the retry, cancel Batch Execution by following the procedure below.

1. Open the project.
2. Click the menu "Migration" → "Migration Options".
3. Change the value of "Batch Execution" to "No".

Data types CHAR and VARCHAR are changed to NCHAR and NVARCHAR.

Cause

MySQL does not support NCHAR or NVARCHAR data types. Instead, it allows for user to specify national character set as an attribute of the CHAR or VARCHAR data type column. The Migration Center converts national character set specified CHAR or VARCHAR column to NCHAR and NVARCHAR column in order to migrate data successfully.

Solution

This phenomenon is normal.

Note

In the default DataType Map of Migration Center, MySQL's NVARCHAR is mapped to NVARCHAR (10666) in Altibase. If the number of bytes per character in the national character set between MySQL and Altibase is different, performing the escalation without consideration of this may cause the schema not to be generated beyond the limit byte count. To avoid this situation, the Migration Center basically fixed the size of the NVARCHAR.

If the data size of the corresponding table column is not large, you can transfer the size of the source database as it is by following the procedure below.

1. Reconcile step: Click on "NVARCHAR" row in "Data Type Mapping"
2. Click the "Change" button
3. Select 'NVARCHAR' as Destination DB Data Type, leave Precision blank, and save

PostgreSQL

The starting value of the sequence migrated to Altibase is set higher than the intended value.

Cause

This issue may occur when a migration is performed while there are active sessions using sequences in PostgreSQL. PostgreSQL sequences are cached on a per-session basis, and a number of values are pre-generated each time a session connects, based on the 'CACHE * INCREMENT BY' setting. For example, if a sequence is created with START WITH 1, INCREMENT BY 1, and CACHE 100, performing SELECT NEXTVAL('seq_name') will return 1 in the first session, but 101 in the second session. Due to this caching behavior of PostgreSQL sequences, when migrating to Altibase, the starting value (START WITH) of the sequence is increased by 'CACHE * INCREMENT BY * (number of sessions - 1) + START WITH'.

Solution

Before performing the migration, all application sessions connected to PostgreSQL must be terminated.

TimesTen

When registering connection information, when clicking "Test" button, error message 'Problems with loading native library / missing methods: no ttjdbcCS in java.library.path' is output.

Cause

This message shows up when the TimesTen Type 2 JDBC is failed to load the native library.

Solution

Install the TimesTen client package on the machine where you want to run the Migration Center, then rerun the Migration Center. If the target operating system is Linux, users have to add the lib directory path of the client package to LD_LIBRARY_PATH environment variable after installing the client package.

When I click "Test" button while registering connection information, I get error message 'Problems with loading native library / missing method: ~\bin\ttjdbcCS1122.dll: Cannot load AMD 64-bit.dll on a IA 32-bit platrom'.

Cause

The error message shows up when incompatible bit-version, 32-bit or 64-bit, between TimesTen client package and the JRE the Migration Center is using.

Solution

Open the executable file (migcenter.bat or migcenter.sh) with an editor and change the value of the environment variable JAVA_HOME. Specify the JAVA_HOME path to the JRE that matches the number of bits in the installed TimesTen client package, then rerun the Migration Center.

When registering connection information, when clicking "Test" button, error message 'Data source name not found and no default driver specified' is displayed.

Cause

This message is output when the DSN value entered in the connection information is invalid.

Solution

Enter the DSN registered in the server into the DSN field.

When registering a database connection, when clicking the "Test" button, "Problems with loading native library/missing methods: Native Library /path/libttjdbcCS.so already loaded in another classloader" is displayed.

Cause

This exception arises from the Java classloader when a TimesTen Type 2 JDBC driver, which relies on a native library, is loaded, and the .so file is then reloaded. This scenario often occurs when performing a connection test, switching to a different JDBC driver, and testing again. According to the Java Native Interface (JNI) specification, native libraries can only be loaded once in a JVM session. For more details, refer to the [JNI Specification - Library Version](#).

Solution

First, exit and restart the Migration Center completely. Then, register the database connections or modify the database connection information as needed.

Tibero

When registering a database connection, when clicking the "Test" button, 'Specified schema object was not found at: SELECT value FROM V\$VERSION WHERE NAME = 'PRODUCT_MAJOR' OR NAME = 'TB_MAJOR' Please review your settings and correct any errors.' is displayed.

Cause

This error occurs because the database user account used to connect to the Migration Center does not have the necessary privilege to query the DICTIONARY for checking the DB version.

Solution

Grant the required DICTIONARY query privileges to the database user account.

- For Tibero 4 or below:
Tibero version 4 or below does not have system privileges for DICTIONARY, so grant the SELECT ANY TABLE privilege. This privilege allows querying objects in any schema.

```
GRANT SELECT ANY TABLE TO user_name;
```

- For Tibero 5 or above:
Grant the SELECT ANY DICTIONARY privilege. This privilege allows querying objects in the DICTIONARY owned by SYS, SYSCAT, and SYSGIS.

```
GRANT SELECT ANY DICTIONARY TO user_name;
```
